

Acknowledgement

First of all, I would like to thank all those who participated to accomplish this research, especially my supervisor Prof. Ali Mohammed Ali (Dept of Electrical Eng. University of Khartoum), who devoted his time for supervision, advice and many useful comments.

Also I would like to thank Ustaz Abd Allah Salih Ali (Sudan University), for his great role to advice through out the year of courses. I would like to express my profound thanks to Ustaz Moutaman Mergani Daf Allah (Karary Academy for Technology), for his useful help and valuable efforts and suggestions through out the period of programming. My deep thanks to my colleague Haj Ahmed Yousif (Karary Academy for Technology), for his useful help. Qualitatively I thank Ustaz Alzien (Electronic lab, University of Khartoum) and Ustaz Gaafar Babikir (Control lab, Sudan University) for laboratory sets and their unparallel cooperation. In front of all I would like to express all my thanks to my parents and my family for their support, encouragement and patience.

Finally, I owe a similar dept to all those who had helped in any way that my memory has failed to recall them in name.

Abstract

In this research work a comprehensive study of stepper motors has been done. The presentation included a historical review as well as the state of the art of stepper motor modern technologies. The detailed study included types, constructional features and performance characteristics. The performance of stepper motors is directly governed by their drivers and control circuitry. While commercial combined drivers and control sequencers are commercially available, there is a clear benefit for building locally designed driver and control sequencer from common integrated circuits and discrete components. The maintenance of such a module would be easy and complete replacement of commercial module is necessary. Stepper motors are commonly controlled by a computer or a microcontroller. An interface circuit using the parallel port of a pc has been designed to control two bipolar stepper motors by using c programming language. The designed system of computer control for two stepper motors has been tested and good results have been obtained.
