Dedication

To my parents and the beloved family

My husband

My children

My teachers

And friends

For giving me never-ending gifts of encouragement, love and patience

Acknowledgement

Heartily thankful to my supervisor, Pro .**Caroline E Ayad**, whose encouragement, guidance and support from the initial idea to the final level enabled me to develop an understanding of the subject, I wishes to express gratitude also to the co supervisor Assistance pro.Hussein AhmedHassanwho was abundantly helpful and offered invaluable assistance, support and guidace. Deepest gratitude also toPro. Mohamed Elfadil Mohamed,without whose knowledge and assistance by analysis of the data this study would notbeen successful.

I offer my regards and blessings Pro.**Moh.O.M.Youssef**whosupported me in all the respect during the completion of the thesis.

Thanks also extended to AlaaAldeen.M, AfraaSidigeandGafar Abdeen for their supports.

I would also like to convey thanks to DAADfor providing the financial means , also for the staff of Diagnostic departments in Alamal National Hospital, Royal care Hospital , Military hospital Omdurman and Aldoha Hospital .

List of Tables

| Table number | Table content | Page |

Abstract

The study was carried out to establish normal Sudanese cochlear measurements using High Resolution Computerized Tomography.

The study was done in Alamal Diagnostic Center, Military Hospital, Royal Care Hospital and Royal Scan Diagnostic Departments, during the period from 2011 up to 2014

A total of 460 Cochlear images were obtained from the scans of the normal hearing group comprised 200 subjects (137 Males and 63 Females), aged 1- 84 years. A control group (n = 30) comprised adult with congenital hearing loss (12 Males and 18 Females), their ages were in arrange between 10- 30 years.

Using high resolution computed tomography volumetric acquisition was obtained of brain scan with slice thickness of 0.5 mm and a reconstruction increment of 0.5 mm, 0.85 pitch, FOV of 70mm. The reconstruction slice was 2 mm. A reference plane was determined parallel to the lateral semicircular canal containing the cochlear modiolus, and the canal for the cochlear nerve, the oval window along with the footplate, and the posterior semicircular canal. Reference slice was computed for each patient and all the measurements were performed exclusively on this plane.

cochlea width, height, cochlea nerve canal width and cochlear nerve CT number, basal turn width, transverse cranial dimension, were all been evaluated. The study showed that for the normal subjects, The mean of the left and right cochlear width measured 5.56 ± 0.58 mm, 5.61 ± 0.40 mm, height were 3.56 ± 0.36 mm, 3.54 ± 0.36 mm, the basal turn width 1.87 ± 0.19 mm, 1.88 ± 0.18 mm, cochlea nerve canal width were 2.02 ± 1.23 , 1.93 ± 0.20 , cochlea nerve CT number were 279.41 ± 159.02 , 306.84 ± 336.9 Hounsfield respectively

as well as the transverse cranial dimensions mean were also been evaluated as 123mm

The measurement for the of hearing loss patients group showed that the mean of the left and right cochlear width were 5.34 ± 0.30 mm, 5.38 ± 0.46 mm and the height were 3.53 ± 0.25 mm, 3.49 ± 0.28 mm, the basal turn width were found to be 1.76 ± 0.13 mm, 1.79 ± 0.13 mm, cochlea nerve canal width were 1.75 ± 0.18 mm, 1.73 ± 0.18 mm, and cochlea nerve signal intensity (CT number) were 232.84 ± 316.82 , 196.58 ± 230.05 Hounsfield respectively.

New equations were established to characterize the cochlea for Sudanese subjects whose ages were known.

The study revealed no significant differences were noted in both sides' measurements and between genders, while the age was found to have an impact on the transverse cranial dimension, right Cochlea nerve canal width and right cochlea nerve CT number significantly at $p < 0.05$.

When comparing normal hearing subjects with the Hearing loss group, The study showed a significant difference in cochlea's measurement it was smaller in deafness subjects at $p < 0.05$.

The study concluded that the Cochlea nerve canal width and CT number can be predicted for the Sudanese subjects whose ages were known and high resolutions computed tomography of temporal bone imaging is the modality of choice in the investigation of cochlear normal anatomy, guided the clinician's management of the hearing loss conditions if abnormalities are acknowledged.

ملخص الدراسة

هدفت الدراسة لتحديد القياسات الطبيعية للقوقعة السمعية لدى السودانين باستخدام الاشعة المقطعية المحوسبة عالية الدقة.

وقد أجريت الدراسة في مركز الاملا لتشخيصي، المستشفى العسكري بامدرمانو مستشفى فبروي الكير و مر كز رويالا لتشخيصيو ذلك في الفترة من عام 2011 حتى عام 2014.

تمت الدراسة على مجموعة 460 منصور القوقعة من مساحل راسو العظم الصدغي . وتألفت مجموعة الاولى من طبيعي السمع من 200 شخصا (137 ذكورا و 63 إناث) ، الذين تتراوح أعمارهم بين 1- 84 عاما .

مجموعة الضبط والمقارنة من قدي السمع كونهن 30 من الراشدين (18 ذكورا و 12 من الاناث) الذين تتراوح أعمارهم بين 10- 30 عاما . تم قياس اتساع القوقعة، الارتفاع، اتساع القاعدة الأساسية للقوقعة، اتساع

قناة العصب السمعي ومقياس عرض الجمجمة، ومدي كثافة النسيج للعصب السمعي العين من طبيعي السمعي سارو يميناً قد كانت قياساتها كالآتي 5.56 ± 0.58 ملم، 5.61 ± 0.40 ملم، الارتفاع 3.56 ± 0.36 ملم، 3.54 ± 0.36 ملم، اتساع القاعدة الأساسية 1.87 ± 0.19 ملم، 1.88 ± 0.18 ملم، اتساع قناة القوقعة العصبية 2.02 ± 1.23 ملم ، 1.93 ± 0.20 ملم، متوسط كثافة نسيج العصب السمعي 279.41 ± 159.02 ، 306.84 ± 336.9 هاونس فيلد علنا التوالي، كما تم قياس اتساع الجمجمة وقد كان متوسط القيم 123 ملم.

تمت القياسات لمجموعة الضبط من الصم وقد أظهرت أن متوسط اليسار واليمين لانتساع القوقعة 0.46 ± 0.58 ملم، 5.34 ± 0.30 ملم وارتفاعها 3.49 ± 0.36 ملم ، 3.53 ± 0.25 ملم ، اتساع القاعدة الأساسية للقوقعة 1.76 ± 0.13 ملم

ملم ، 1.79 ± 0.13 ملم واتساع قناة العصب القوقعي 1.73 ± 0.18 $1.75 \pm$
0.18 ملم، متوسط كثافة نسيج العصب السمعي 196.58 \pm 230.05، 232.84 \pm
316.82 هاونسفيلد علالتوالي و متوسط اتساع الجمجمة 123 ملم

تم من خلال الدراسة وضع معادلات تمكن من التنبؤ بقياسات القوقعة السمعية الطبيعية
للسودانيين متي ما كانت معروفة أعمارهم

وقد توصلنا لدراسة لعدم وجود فروق كبيرة في كلا الجانبين والجنسين، في حين تم إثبات أن العمر يكون له تأثير
ر على اتساع
الايمن ومتوسط كثافة العصب القوقعي الايمن بشكل كبير في مدي احتمالية < 0.05 .

عند مقارنة قياسات القوقعة لذوي السمع الطبيعي و فاقد السمع وجدنا فروقا كبيرة في جميع القياسات اذ هيأصد
غر لدي الصم في مدي احتمالية < 0.05 .

خلصنا لدراسة إلى أنه يمكن التنبؤ بقياسات القوقعة الطبيعية للسودانيين المعروف أعمارهم و
الي ان التصوير بالأشعة المقطعية عالية الدقة في تصوير العظام الصدغيه والطريقة الافضل في
تحديد التشريح الطبيعي للقوقعة، لاسترشاد الجهة التشخيصية لتحديد اسباب فقدان السمع والولادي.
