## CHAPTER THREE

## MANUAL ANALYSIS AND DESIGN

### 3.1Introduction:

The first function in design is the planning carried out by the architect to determine the arrangement and layout of the building to meet the client's requirements. Architect and engineer should work together at this conceptual design stage. The design of different structures is achieved by performing, in general, two main steps: (1) determining the different forces acting on the structure after estimation of loads using proper methods of structural analysis, (2) proportioning all structural members economically, considering the safety, stability, serviceability, and functionality of the structure [12].

### 3.2 Description of Case Studied:

A forty story concrete framed tube building,
-Basic wind speed: $100 \mathrm{mph}(45 \mathrm{~m} / \mathrm{s})$

- Terrain: flat
-Plan Dimension: 20* $15 \mathrm{~m}^{2}$
-Building Height: 128.8 m
-Story height: 3.2 m and 4 m for ground floor
-Building lateral system: perimeter tube with exterior columns typically spaced at 5 m , with spandrel beams and core at centre of the building.
-Building Use: health care facilities.
-Typical Floor Live Load: $2.4 \mathrm{kN} / \mathrm{m}^{2}$
-RoofLiveLoad: $0.96 \mathrm{kN} / \mathrm{m}^{2}$
-Super Imposed Dead Load:
Floor: $1.5 \mathrm{kN} / \mathrm{m}^{2}$ (ceiling load and partition)
Roof: $1.075 \mathrm{kN} / \mathrm{m}^{2}\left(0.48 \mathrm{kN} / \mathrm{m}^{2}+200 \mathrm{kN} / \mathrm{m}^{2}\right.$ for penthouse $)$
- Member Section:

Beam section: $0.9 * 0.3 \mathrm{~m}^{2}$
Column section: $0.8 * 0.8 \mathrm{~m}^{2}$
Wall thickness: 300 mm
Slab depth: 200mm

- Material Properties:
$\mathrm{W}_{\mathrm{c}}=24 \mathrm{kN} / \mathrm{m}^{3}$
$\mathrm{W}_{\mathrm{m}}=22 \mathrm{KN} / \mathrm{m}^{3}$
$\mathrm{f}_{\mathrm{y}}=420 \mathrm{~N} / \mathrm{mm}^{2}$
$\mathrm{f}_{\mathrm{c}}{ }^{\prime}=35 \mathrm{~N} / \mathrm{mm}^{2}$
$\mathrm{f}_{\mathrm{ys}}=250 \mathrm{~N} / \mathrm{mm}^{2}$

Fig. (3.1): Floors Plan

### 3.3 Analysis results:

### 3.3.1 Wind Loads Calculation:

- Wind design data is as follows:
$\mathrm{V}=45 \mathrm{~m} / \mathrm{sec}$
Assuming, the building is a health care facilities with a capacity of 50 or more resident patients, so, occupancy category is III (ASCE7-05 table 1-1) and the exposure categories is D (the ground surface roughness ASCE7-05-6.5.6.3)
For exposure (D), I = 1.25 according to ASCE7-05 table 6-1(Appendix A)
$\mathrm{k}_{\mathrm{d}}=0.85$ for main wind force resisting systems of buildings according to ASCE7-05 table 6-4 (Appendix A)
$\mathrm{k}_{\mathrm{z}}=2.01\left(\mathrm{z} / \mathrm{z}_{\mathrm{g}}\right)^{2 / \mathrm{e}}$
$\mathrm{e}=11.5$ for exposure D according to ASCE7-05 table 6-2 (Appendix A)
$\mathrm{z}_{\mathrm{g}}=213$ for exposure D according to ASCE7-05 table 6-2 (Appendix A)
$\mathrm{k}_{\mathrm{z}}$ at the $40^{\text {th }}$ story $=2.01(128.8 / 213)^{2 / 11.5}=1.842$
$\mathrm{k}_{\mathrm{zt}}=1$ assuming the terrain is flat (Appendix A)
$\mathrm{G}_{\mathrm{f}}=0.925\left(\left(1+1.7 \mathrm{I}_{\mathrm{z}} \sqrt{ }\left(\mathrm{g}_{\mathrm{Q}}{ }_{\mathrm{Q}} \mathrm{Q}^{2}+\mathrm{g}_{\mathrm{g}}^{2} \mathrm{R}^{2}\right) /\left(1+1.7 \mathrm{~g}_{\mathrm{v}} \mathrm{I}_{\mathrm{z}}\right)\right) \quad\right.$ Equation 6-8 from ASCE7-05
$\mathrm{G}_{\mathrm{f}}=0.94$
$\mathrm{q}_{\mathrm{z}}=0.613 \mathrm{k}_{\mathrm{z}} \mathrm{k}_{\mathrm{zz}} \mathrm{k}_{\mathrm{d}} \mathrm{V}^{2} \mathrm{I}$
$\mathrm{q}_{\mathrm{z}}=0.613 \times 1.842 \times 1 \times 0.85 \times 1.25 \times 45^{2}=2429 \mathrm{~N} / \mathrm{m}^{2}$
Assuming the building is enclosed (ASCE6.5.9), $\mathrm{GC}_{\mathrm{pi}}= \pm 0.18$
$\mathrm{C}_{\mathrm{p}}$ for wind in E-W direction (ASCE7-05 figure 6.6), (Appendix A)
$\mathrm{C}_{\mathrm{p}}($ wind ward wall $)=0.8$
$\mathrm{C}_{\mathrm{p}}($ lee ward wall $)=-0.5$
$\mathrm{C}_{\mathrm{p}}($ side wall $)=-0.7$
$\mathrm{C}_{\mathrm{p}}($ over entire roof $)=-1.3$
$\mathrm{P}_{\text {windward }}($ external pressure $)=\mathrm{qGC}_{\mathrm{p}}=2429 \times 0.94 \times 0.8=1827 \mathrm{~N} / \mathrm{m}^{2}$
$\mathrm{P}($ internal pressure $)=\mathrm{qGC}_{\mathrm{pi}}=2429 \times( \pm 0.18)=437 \mathrm{~N} / \mathrm{m}^{2}$
$P_{\text {leeward }}($ external pressure $)=2429 \times 0.94 \times 0.5=1142 \mathrm{~N} / \mathrm{m}^{2}$
$\mathrm{P}=\mathrm{P}_{\text {wind ward }}+\mathrm{P}_{\text {lee ward }}=98.8 \mathrm{kN}$
Wind loads at story level are shown in table (3.1).
Table (3.1): Summary of Wind Loads at Story Level

| Level | Story height <br> $(\mathrm{m})$ | Position (m) | Tributary area <br> $(\mathrm{m})$ | Design Wind Load <br> $(\mathrm{kN})$ |
| :--- | :--- | :--- | :--- | :--- |

### 3.3.2 Distribution of Wind Loads:

Wind load percentage carried by core $=\mathrm{EI}_{\text {core }} /\left(\mathrm{EI}_{\text {core }}+\mathrm{GA}_{\text {frames }}\right)=$ $14.29 \times 2.78 \times 10^{7} /\left(14.29 \times 2.78 \times 10^{7}+128.2 \times 10^{7}\right)=24 \%$

Wind load percentage carried by four frames $=1-0.24=76 \%$
Table 3.2 shows the distribution of wind loads
Table (3.2): Distribution of Wind Loads between Core and Frames

| Level | story height <br> $(\mathrm{m})$ | Position (m) | Load resist by <br> core $(\mathrm{kN})$ | Load resist by <br> Frames $(\mathrm{kN})$ |
| :--- | :--- | :--- | :--- | :--- |

### 3.3.3 Load Resisted by Frame (1) in Fig. (3.1):

Shear rigidity of frames $(1,2,5,6)$
$\mathrm{GA}_{(1,6)}=12 \mathrm{E} / \mathrm{h}((1 / \mathrm{C})+(1 / \mathrm{G}))=19.3 \times 10^{7}$
Shear rigidity of frames (2) and (5)
$\mathrm{GA}_{(2,5)}=44.8 \times 10^{7}$
Rigidity of frame (1) $=\mathrm{GA}_{1} /\left(\mathrm{GA}_{1}+\mathrm{GA}_{6}+\mathrm{GA}_{2}+\mathrm{GA}_{5}\right)=20 \%$
Load resisted by frame (1) is shown in table (3.3)
Table (3.3): Load Resisted by Frame (1)

| Level | Position (m) | Wind Load (kN) | S.F at mid story (kN) |
| :--- | :--- | :--- | :--- |
| $40^{\text {th }}$ | 128.8 | 15 | 15 |
| $39^{\text {th }}$ | 125.6 | 30 | 45 |

### 3.3.4 Analysis of Gravity Loads:

Gravity Loads on beam (C11-C10)
$\mathrm{DL}_{\text {floor }}=45 \mathrm{kN} / \mathrm{m}$
$L_{\text {floor }}=5 \mathrm{kN} / \mathrm{m}$
$\mathrm{DL}_{\text {roof }}=35 \mathrm{kN} / \mathrm{m}$
$L_{\text {roof }}=2 \mathrm{kN} / \mathrm{m}$

Fixed end moments $=\mathrm{wL}^{2} / 12, \quad \mathrm{~L}=5 \mathrm{~m}$
By moments distribution method
Stiffness $\left(\mathrm{k}_{\text {(beam or column }}\right)=\mathrm{I} / \mathrm{L}_{\text {(beam or column) }}$
Moment of inertia $\left(\mathrm{I}_{\text {(beam or column }}\right)=\mathrm{bh}^{3} / 12$
Distribution factor $(\mathrm{DF})=\mathrm{k} / \Sigma \mathrm{k}$
Bending moments and shear forces under gravity loads are shown in table (3.4)
Table (3.4): Summary of Bending Moments and Shear Forces under Gravity Loads for beam (C11-C10) and beam (C10-C9)

| Cases |  | Location |  | B.M (kN-m) | S.F (kN) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| For Roof | Span <br> (C11-C10) | Support | Exterior | -116 | -68 |
|  |  |  | Interior | 42 | 55 |
|  |  | Mid span |  | 51 |  |
|  | Span(C10-C9) | Support | First | -53 | -58.4 |
|  |  |  | Second | -53 | 58.4 |
|  |  | Mid span |  | 25 |  |
| For Floors | Span <br> (C11-C10) | Support | Exterior | -128 | -100 |
|  |  |  | Interior | 68 | 76 |
|  |  | Mid span |  | 57.7 |  |
|  | Span(C10-C9) | Support | First | -71 | -60 |
|  |  |  | Second | -71 | 60 |
|  |  | Mid span |  | 40 |  |
| For First <br> Floor | $\begin{aligned} & \text { Span } \\ & \text { (C11-C10) } \end{aligned}$ | Support | Exterior | -85 | -80 |
|  |  |  | Interior | 65 | 72 |
|  |  | Mid span |  | 49 |  |
|  | Span(C10-C9) | Support | First | -69.3 | -82.5 |
|  |  |  | Second | -69.3 | 82.5 |
|  |  | Mid span |  | 35 |  |

- Beams shear force and bending moment diagrams due to gravity loads are shown in Figures bellow.

Gravity Loads for Beams at Floors Level

Fig. (3.4): Bending Moments Diagrams due to Gravity Loads for Beams at Roof Level

Fig. (3.5): Bending Moments Diagrams due to Gravity Loads for Beams at Floors Level

### 3.3.5 Analysis of Wind Loads:

By cantilever method
Wind load at $40^{\text {th }}$ story level (frame 1 ) $=15 \mathrm{kN}$
External moment due to wind $=15 \times 1.6=24 \mathrm{kNm}$
Second moment of area

$$
=1\left(7.5^{2}+2.5^{2}+2.5^{2}+7.5^{2}\right)=125 \mathrm{~m}^{4}
$$

Column(C11) axial forces

$$
=24 \times 7.5 / 125=1.5 \mathrm{kN}
$$

Shear forces at beam $(\mathrm{C} 11-\mathrm{C} 10)=1.5 \mathrm{kN}$
Moment at left end of beam $(\mathrm{C} 11-\mathrm{C} 10)=1.5 \times 2.5= \pm 4 \mathrm{kNm}$
Bending moments and shear forces under wind loads are shown in table (3.5) and (3.6)

Table (3.5): Summary of Bending Moments and Shear Forces for Beam
(C11-C10) under Wind loads

- Beams bending moment, shear forces diagrams due to wind loads are shown in figures bellow.

Fig. (3.6): Bending Moment Diagrams due to
Wind Loads For Beam at $20^{\text {th }}$ Story Level

Fig. (3.7): Shear Forces Diagrams due to
Wind Loads for Beam at $20^{\text {th }}$ Story Level

### 3.3.6 Column C11 Axial Loads Calculations (at $40^{\text {th }}$ Story Level)

- Dead load:

Tributary area $=9 \mathrm{~m}^{2}$
Column self weight $=0.8 \times 0.8(3.2-0.9-0.2) \times 24=32.3 \mathrm{kN}$
Slab self weight within the tributary area $=36.3 \mathrm{kN}$
Beam self weight within the tributary area $=29.2 \mathrm{kN}$
Masonry weight $=5 \times 0.3 \times 1 \times 22=33 \mathrm{kN}$
Super imposed dead load for roof $=9.7 \mathrm{kN}$
Total axial loads at $40^{\text {th }}$ story level
$36.3+33+29.7+9.7=118.2 \mathrm{kN}$

- Live load $=0.96 \times 9=8.6 \mathrm{kN}$

Axial load due to dead, live and wind are shown in table (3.7)
Table (3.7): Summary of Axial Load for Col (C11)

| Level | Height (m) | Dead Load (kN) | Live Load (kN) | Wind load (kN) |

### 3.4.7 Column C10 Axial Loads Calculations at $\mathbf{4 0}^{\text {th }}$ Story Level

- Dead load:

Tributary area $=15 \mathrm{~m}^{2}$
Column self weight $=0.8 \times 0.8(3.2-0.9-0.2) \times 24=32.3 \mathrm{kN}$
Slab self weight within the tributary area $=69.6 \mathrm{kN}$
Beam self weight within the tributary area $=46 \mathrm{kN}$
Masonry weight $=5 \times 0.3 \times 1 \times 22=33 \mathrm{k}$
Superimposed dead load for roof $=1.07 \times 15=17.2 \mathrm{kN}$
Total axial loads at $40^{\text {th }}$ story level due to dead loads;
$70+46+33+17.2=167 \mathrm{kN}$

- Live load $=0.96 \times 15=14.4 \mathrm{kN}$

Axial load due to dead, live and wind are shown in table (3.9)

Table (3.9): Summary of Axial Forces for Col (C10)

### 3.4 Design Results:

### 3.4.1 Design of Slab:

- Two way solid slab designed by direct design method, it is currently the most common method of analysis in designing concrete floor systems.

Moment transfer between the slab, beam and column , the structure is divided into a series of equivalent frames along support lines. Each frame consists of a row of columns and corresponding slab-beam strip.
Floor slab and roof slab design calculations are shown in tables (3.13) and (3.15)

## Table (3.12): Summary of Design Bending Moments for slab (an Edge

## Panel)

| Cases | Location | Column strip moment |  | Middle strip |
| :--- | :--- | :--- | :--- | :--- |
|  |  | Beam | Slab | slab moment |
| Floors | Interior negative | 55.3 | 10 | 22 |
|  | Interior positive | 45.3 | 8 | 20 |

|  | Exterior negative | 17 | 3 | 0 |
| :--- | :--- | :--- | :--- | :--- |
| Roof | Interior negative | 45.3 | 8 | 18.1 |
|  | Interior positive | 37.4 | 7 | 14.2 |
|  | Exterior negative | 14 | 2.5 | 0 |

Table (3.13): Floor Design Calculations

### 3.4.2 Design of Beams:

Beams must have an adequate safety margin against other types of failure (flexural and shear).
Beams flexural and shear design calculations shown in tables (3.18), (3.20), (3.22), (3.24), (3.26) and (3.28).

Table (3.18): Flexural Beam Design Calculations at First Story

| Reference | Calculations | Out Put |
| :--- | :--- | :--- |
| ACI318-05 | 1-Flexural Design: |  |
| 21.12 .4 | The factored axial load on the member, Which is <br> negligible, is less than $\mathrm{Ag}_{\mathrm{g}} \mathrm{f}_{\mathrm{d}} / 10$, for beams must be <br> satisfied. <br> All other applicable provisions in ACI318-05 are to <br> be satisfied as well. <br> ACI318-05 |  |

Table (3.19): Required Beam Reinforcement at First Story

| Location | $\mathrm{M}_{\mathrm{u}}(\mathrm{m}-\mathrm{kN})$ | $\mathrm{A}_{\mathrm{s}}\left(\mathrm{mm}_{2}\right)$ | Reinforcement | $\emptyset \mathrm{Mn}(\mathrm{m}-\mathrm{kN})$ |
| :--- | :--- | :--- | :--- | :--- |
| Support | -660 | 2455 | $5-\mathrm{No} 25$ | 690 |
| Mid span | 61 | 942 | $3-\mathrm{No} 20$ | 260 |

ACI21.12.4.1: the positive moment strength at the joint be greater than or equal to $33 \%$ of the negative moment strength at that location. This is satisfied, since $260 \mathrm{~m}-\mathrm{KN}>690 \times 0.33=227.7 \mathrm{~m}-\mathrm{KN}$.

Table (3.20): Shear Design Calculation at First Story

The provided reinforcement ratio is within the allowable rang of | 349 mm <br> 730 mm |

| ACI21.12.3 | 1\% and 8\% |  |
| :---: | :---: | :---: |
|  | 2.Design for Shear |  |
|  | Columns in intermediate moment frames must satisfy |  |
|  | the shear requirements in. The first of the two options |  |
|  | in that section is utilized here to determine the design |  |
|  | shear strength: |  |
|  | The sum of the shear associated with development of |  |
|  | nominal moment strengths of the member at each |  |
|  | restrained end of the clear span and the shear |  |
|  | calculated for the factored gravity loads. |  |
|  | Because the column is at twenty floor, and the |  |
|  | moment at any column end cannot exceed the |  |
|  | average of the nominal moment strengths of the |  |
|  | beams framing into that end, shear demand from the |  |
|  | lateral forces is calculated from the nominal flexural |  |
|  | strengths of the beams. |  |
|  | $\mathrm{V}_{\mathrm{u}}=(560+260) / 1.6$ | $512.5 \mathrm{kN}>$ |
|  | The shear capacity of the column for members | 142 kN |
| ACI318-05 | subjected to axial compression: |  |
| Eq. (11.4) | $\mathrm{V}_{\mathrm{c}}=0.17\left(1+\mathrm{N}_{\mathrm{u}} / 14 \mathrm{~A}_{\mathrm{g}}\right) \sqrt{ } \mathrm{f}_{\mathrm{c}}^{\prime} \mathrm{b}_{\mathrm{w}} \mathrm{d}$ |  |
|  | $0.17\left(1+\left(7778000 / 14 \times 800^{2}\right)\right) \sqrt{35 \times 800 \times 730 / 1000}$ | 1097 kN |
|  | Since $\mathrm{V}_{\mathrm{u}}>\emptyset \mathrm{V}_{\mathrm{c}} / 2=0.75 \times 1097 / 2$ | 411 kN |
| ACI11.5.6.1 | minimum transverse reinforcement would be |  |
|  | required. |  |
|  |  |  |
|  | With No. 10 hoops with one cross-site, $\mathrm{A}_{\mathrm{v}}=213 \mathrm{~mm}^{2}$ |  |
| ACI318-05 | $\mathrm{S}=213 \times 250 /(.062 \times 800 \sqrt{35})$ | 181.5 mm |
| 11.5.5.1 | $<\mathrm{d} / 2=730 / 2$ | 365 mm |

| ACI11.5.5.2 | $S_{\text {required }}=181.5 \mathrm{~mm}$ <br> For No 12 rectangular hoops, the vertical spacing s <br> 0 |  |
| :--- | :--- | :--- |
| must not exceed the smallest of the flowing: |  |  |
| ACI21.12.5. | $-8($ smallest longitudinal bar diameter $)=8 \times 31.5$ <br> 3 | Use No -10 hoops and crossties @ 200 mm with the <br> first hoop located at $100 \mathrm{~mm}\left(<\mathrm{S}_{0} / 2=228 / 2=114 \mathrm{~mm} ;\right.$ <br> from the joint face below twenty floor level and <br> above the twenty-one level. | | 252 mm |
| :--- |

Table (3.33): Design of Column C11 at $40^{\text {th }}$ Story Level

| Load Cases | Axial load (kN) | B.M (kNm) | S.F (kN) |
| :--- | :--- | :--- | :--- |
| Gravity (DL+LL) | 130 | -94 | 0 |
| Wind (WL) | $\pm 2$ | $\pm 5$ | $\pm 3.1$ |
| Load Combination |  |  |  |
| $1.2 \mathrm{DL}+1.6 \mathrm{LL}$ | 160 | -117 | 0 |
| $1.2 \mathrm{DL}+\mathrm{LL} \pm 1.6 \mathrm{WL}$ | 178 | 112 | 5 |

Table (3.34): Column Axial Forces and Bending Design Calculations at 40 ${ }^{\text {th }}$ Story Level

| Reference | Calculation | Out Put |
| :---: | :--- | :---: |
|  | 1.Design for Axial Force and Bending <br> Since the design strength not investigated <br> requirement of ACI for using interaction chart, so <br> design using basic equations, consider this, |  |

| ACI10.9.1 | with 13-No. 25 bars $\left(\rho_{\mathrm{g}}=1 \%\right)$ is adequate for column supporting the first floor level. The provided reinforcement ratio is within the allowable rang of $1 \%$ and $8 \%$ <br> 2.Design for Shear |  |
| :---: | :---: | :---: |
| ACI21.12.3 | Columns in intermediate moment frames must satisfy the shear requirements. The first of the two options in that section is utilized here to determine the design shear strength: <br> The sum of the shear associated with development of nominal moment strengths of the member at each restrained end of the clear span and the shear calculated for the factored gravity loads. <br> Because the column is at roof, and the moment at any column end cannot exceed the average of the nominal moment strengths of the beams framing into that end, shear demand from the lateral forces is calculated from the nominal flexural strengths of the beams. $V_{u}=(260+260) / 1.6$ <br> The shear capacity of the column w for members subjected to axial compression: | $\begin{aligned} & 325 \mathrm{kN}> \\ & 5 \mathrm{kN} \end{aligned}$ |
| ACI318-05 | $\mathrm{V}_{\mathrm{c}}=0.17\left(1+\mathrm{N}_{\mathrm{u}} / 14 \mathrm{~A}_{\mathrm{g}}\right) \sqrt{\mathrm{f}_{\mathrm{c}}} \mathrm{b}_{\mathrm{w}} \mathrm{d}$ |  |
| Eq. (11.4) | $0.17\left(1+\left(178000 / 14 \times 800^{2}\right)\right) \sqrt{ } 35 \times 800 \times 730 / 1000$ <br> Since $\mathrm{V}_{\mathrm{u}}>\emptyset \mathrm{V}_{\mathrm{c}} / 2=0.75 \times 599 / 2$ <br> minimum transverse reinforcement would be required. | $\begin{aligned} & 599 \mathrm{kN} \\ & 224.6 \mathrm{kN} \end{aligned}$ |
| ACI11.5.6.1 | $\mathrm{A}_{\mathrm{v}, \min }=.062 \sqrt{\mathrm{f}_{\mathrm{c}}^{\prime} \mathrm{b}_{\mathrm{w}} \mathrm{~S} / \mathrm{f}_{\mathrm{yt}}}$ |  |

| ACI 11.5.5.1 | With No. 10 hoops with one cross-site, $\mathrm{A}_{\mathrm{v}}=$ |  |
| :---: | :---: | :---: |
|  | $\mathrm{S}=213 \times 250 /(.062 \times 800 \sqrt{35})$ | 181.5 mm |
|  | $<\mathrm{d} / 2$ | 365 mm |
|  | Thus, $\mathrm{S}_{\text {required }}=181.5 \mathrm{~mm}$ |  |
| ACI11.5.5.2 | For No 12 rectangular hoops, the vertical spacing $\mathrm{s}_{0}$ must not exceed the smallest of the flowing: |  |
|  | $\begin{aligned} & -8(\text { smallest longitudinal bar diameter })= \\ & 8 \times 24.5 \end{aligned}$ | 196 mm |
|  | $-24($ hoop bar diameter $)=24 \times 9.5$ | 228 mm |
| ACI21.12.5.3 | Use No 12 hoops and crossties @ 200mm with the first hoop located at $90 \mathrm{~mm}\left(<\mathrm{S}_{0} / 2=196 / 2=98 \mathrm{~mm}\right.$; from the joint face below forty floor level. |  |

Table (3.35): Design Axial Forces, Bending Moments and Shear Forces at Base of Shear Wall on Line3

| Load Cases | Axial (kN) | Bending (kNm) | Shear (kN) |
| :--- | :--- | :--- | :--- |
| Dead | 8810 | 0 | 0 |
| Live | 1296 | 0 | 0 |
| Wind | 0 | 58310 | 858 |
| Load Combination |  |  |  |
| $1.2 \mathrm{DL}+1.6 \mathrm{LL}$ | 11417 | 0 | 0 |
| $1.2 \mathrm{DL}+\mathrm{LL} \pm 1.6 \mathrm{WL}$ | 11868 | 93296 | 1373 |

### 3.5.4 Design of Shear walls:

Walls should be designed to resist all loads to which they are subjected, including eccentric axial loads and lateral forces.

Shear wall design calculations shown in table (3.36).

Table (3.36): Wall Shear Design Calculations
