## Chapter Four

## Case Study \& Design

### 4.1 Introduction

This Chapter deals with the study of designing of Formwork for the flat slab of residential building used as a case study which consists of four floors with an area ( 2377.6 ft .sq). The study includes design for Sheathing, Joist, Stringer and Shore, according to the requirements of the ACI Committee 347. And the design calculations have been done through excel spreadsheets program following the design steps mentioned in chapter three.

### 4.1.1 Case study

The plan of the case study used, is shown in Figure (4.1) and in the following there are more details and assumptions about it:
Concrete construction building with building area 2377.6 fit square ( $202.5 \mathrm{~m}^{2}$ ) for the purpose of Design, assume the formwork used to support flat slab floor of a thickness of 7.9 inches ( 20 cm ) and conventional density concrete.
Sheathing will be ply-wood that has the following characterize

- Type : APA B-B ply-form class 1 with species group of face ply $=2$ (sanded panels).
- Dry Conditions.
- Thickness $=11 / 8 \quad$ in $(2.85 \mathrm{~cm})$

Figure (4.1): Case Study
In the following there are design calculations for the elements of formwork of flat slabs as formulated in the excel spreadsheet.

### 4.2 Manual Design:

### 4.2.1Design Loads:

*Dead load $=$ weight of concrete + weight of the formwork

$$
\begin{aligned}
& =7.9 / 12^{\text {in }} \text { of concrete } \times 150+5.0 \quad \text { (assumed) } \\
& =98.75+5=103.75 \mathrm{Ib} / \mathrm{ft}^{2}
\end{aligned}
$$

*Live load $=75 \mathrm{Ib} / \mathrm{ft}^{2} \quad($ according to $\mathrm{ACI}=347)$.
*Total vertical load $=75+103.75=178.75 \mathrm{Ib} / \mathrm{ft}^{2}$

### 4.2.2 Sheathing :

$*$ Thickness $=11 / 8$ in.$($ Sanded panels $)$
*from Table (3.12) to (3.14) we get the following properties :
Grade stress Level S-2

$$
\begin{aligned}
& \mathrm{A}=3.854 \mathrm{in}^{2} \\
& (\mathrm{KS})=0.820 \mathrm{in} 3 / \mathrm{ft} \\
& \mathrm{I}=0.548 \mathrm{in}^{4} \\
& \mathrm{Ib} / Q=9.883 \mathrm{in} 2 / \mathrm{ft} \\
& F_{b}=1200 \mathrm{psf} \\
& F_{v}=140 \mathrm{psf} \\
& \mathrm{E}=1.5 * 10^{6} \mathrm{psf}
\end{aligned}
$$

*Consider 1-ft strip. It carries a load of $178.75 \times 1=178.75 \mathrm{Ib} / \mathrm{ft}$
From Table (3.15), using 3 or more spans:

## Bending:

$$
\begin{gathered}
w_{b}=\frac{120 F_{b}(K S)}{l_{1}^{2}} \\
178.75=\frac{120 * 1200 * 0.82}{l_{1}^{2}}
\end{gathered}
$$

get

$$
=\underline{\underline{25.70}} \mathrm{in} l_{1}
$$

## Shear:

$$
\begin{gathered}
w_{s}=20 F_{v} \frac{\mathrm{Ib} / Q}{l_{2}} \\
178.75=\frac{20 * 140 * 9.833}{l_{2}} \\
=\underline{\underline{154.027}} \mathrm{in} l_{2}
\end{gathered}
$$

## Deflection:

$$
\begin{gathered}
\Delta=\frac{w l_{3}{ }^{4}}{1740 E I} \\
<\frac{l_{3}}{360} \\
\frac{l_{3}}{360}=\frac{178.75 * l_{3}{ }^{4}}{1740 * 1.5 * 10^{6} * 0.548} \\
=\underline{\underline{28.12}} \text { in } l_{3}
\end{gathered}
$$

Bending governs. Allowable span $=25.70$ in
joist spacing $=25.70 / 12.5=2.056 \mathrm{ft}$.

### 4.2.3 Joists:

From Table (3.6) to (3.8), we can get the following values for Redwood (select-structural):
$=1350 \mathrm{psi} F_{b}$
$=80 \mathrm{psi} F_{v}$
$=650 \mathrm{psi} \quad F_{c \perp}$

$$
E=1.4 * 10^{6} \mathrm{psi}
$$

Temperature factor $C_{f}=1.0$
Load duration factor $C_{D}=1.25$
Shear stress factor $C_{H}=2.0$ (no split case)
Choose $2 \times 6$ Redwood which has the following characteristics:

$$
\begin{aligned}
& \mathrm{A}=8.25 \mathrm{in}^{2} \\
& \mathrm{~S}=7.563 \mathrm{in}^{3} \\
& \mathrm{I}=20.8 \mathrm{in}^{4} \\
& \quad \mathrm{~d}=5.5 \mathrm{in} \\
& \quad C_{f}=1.20
\end{aligned}
$$

Load $/ \mathrm{ft}$ of joist $=178.75 \times 2.056=367.51 \mathrm{ib} / \mathrm{ft}$

## Bending :

$$
\begin{gathered}
F_{b}^{\prime}=F_{b}\left(C_{f}\right)\left(C_{t}\right)\left(C_{D}\right) \\
=1350 \times 1.2 \times 1.0 \times 1.25=2025 \mathrm{ib} / \mathrm{ft}
\end{gathered}
$$

From Table (3.16)

$$
\begin{aligned}
& l=10.95\left(\frac{F_{b}^{\prime} * S}{w}\right)^{1 / 2} \\
= & 10.95\left(\frac{2025 * 7.563}{367.51}\right)^{1 / 2} \\
= & 70.686 \mathrm{in}=\underline{\underline{5.654}} \mathrm{ft}
\end{aligned}
$$

## Shear :

$$
\begin{aligned}
& F_{v}^{\prime}=F_{v}\left(C_{H}\right)\left(C_{t}\right)\left(C_{D}\right) \\
& =80 \times 2.0 \times 1.0 \times 1.25=200 \mathrm{psi} \\
& l=13.3\left(\frac{F_{v}^{\prime} * A}{w}\right)+2 * d \\
= & 13.3 * \frac{200 * 8.25}{367.51}+2 * 5.5 \\
= & 70.712 \mathrm{in}=\underline{\underline{5.657 \mathrm{ft}}}
\end{aligned}
$$

## Deflection :

$$
E^{\prime}=1.4 * 10^{6} p s i
$$

$$
\begin{gathered}
\Delta<\frac{l}{360} \\
l=1.69\left(\frac{E I}{w}\right)^{1 / 3} \\
=1.69\left(\frac{1.4 * 10^{6} * 20.8}{367.51}\right)^{1 / 3} \\
=72.587 \mathrm{in}=\underline{\underline{5.80} \mathrm{ft}}
\end{gathered}
$$

Shear governs. Span of joists $=70.686$ in $\approx 5.654 \mathrm{ft}(\mathrm{OK})$

### 4.2.4 Stringers:

Load on a stringer is $=178.75 \times 5.654=1010.65 \mathrm{Ip} / \mathrm{ft}$
Use $2 \times 8$ (tow stringers)
$\mathrm{b}=1.5 \mathrm{in}$
$\mathrm{d}=7.25$ in
$\mathrm{I}=47.63 \mathrm{in}^{4}$
$\mathrm{A}=10.88 \mathrm{in}^{2}$
$\mathrm{S}=13.14 \mathrm{in}^{3}$
$\mathrm{E}=1.4 * 10^{6} \mathrm{psi}$
$C_{f}=1.2$

## Bending :

$$
\begin{aligned}
& \quad F_{b}^{\prime}=F_{b}\left(C_{f}\right)\left(C_{t}\right)\left(C_{D}\right) \\
& \quad=1350 \times 1.2 \times 1.0 \times 1.25=2025 \mathrm{psi} \\
& \quad l=10.95\left(\frac{F_{b}^{\prime} * S}{w}\right)^{1 / 2} \\
& =10.95\left(\frac{2025 * 13.14 * 2}{1010.65}\right)^{1 / 2} \\
& =79.45 \mathrm{in} \quad=\underline{\underline{6.36 \mathrm{ft}}}
\end{aligned}
$$

## Shear :

$$
\begin{gathered}
l=13.3 *\left(\frac{F_{v}^{\prime} * A}{w}\right)+2 * d \\
=\frac{13.3 * 200 *(10.87 * 2 \text { twostringers })}{1010.65}+2 * 7.25 \mathrm{in} \\
=71.719 \mathrm{in} \quad=\underline{\underline{5.74 \mathrm{ft}}}
\end{gathered}
$$

## Deflection:

$$
\begin{gathered}
\Delta<\frac{l}{360} \\
l=1.69 *\left(\frac{1.4 * 10^{6} * 47.63 * 2}{1010.65}\right)^{1 / 3} \\
=86.04 \mathrm{in} \quad=\underline{\underline{6.88 \mathrm{ft}}}
\end{gathered}
$$

Take stringer spacing $=\underline{\underline{5.74}} \mathrm{ft}$

## * Check for crushing ( joist on stringer ) :

Force transmitted from joist to stringer is equal to load of joist/ft
multiplied by the span of the joist, force $=5.654 \times 367.51=2077.90 \mathrm{Ib}$
Area through which this force is transmitted $=1.5 \times 3=4.5 \mathrm{in}^{2}$
Crushing stress $=2077.90 / 4.5=461.75 \mathrm{Ib} / \mathrm{in}^{2}$

From Table 3.6a, we get the following properties :
$=650 \mathrm{Ib} / \mathrm{in}^{2} F_{c \perp}$
Bearing area factor $=1.25(\mathrm{~b}=1.5$ in $)$
Temperature factor $=1.0$

$$
F^{\prime}{ }_{c \perp}=F_{c \perp}\left(C_{b}\right)\left(C_{t}\right)
$$

$=650 \times 1.25 \times 1=812.5 \mathrm{psi}$ since $461.75<812.5 \quad$ (safe in crushing)

## Shore strength :

Required shore spacing $=($ stringer span $)$
Shore strength $=$ span of stringer $\times$ load of stringer

$$
=5.74 \times 1010.65=5801 \mathrm{Ib}
$$

So we use shores strength is larger than 6000Ib

## Design by Microsoft Excel:

### 4.3 In-put Data [See Figs. (4.2) - (4.4)]

Fig.(4.2): Excel Spread Sheet Menu.

Fig.(4.3): Input data Menu.

Fig.(4.4): Design Load Menu.

### 4.3.1 Slab Input

$=$ thickness of slab $\quad 7.9$ in

## Sheathing:

$$
\text { thickness of sheathing }=\quad 11 / 8 \quad \text { in } \quad \text { (Sanded panels) }
$$

from Tables (3.12) to (3.14)(Appendix B), we get the following properties :

$$
\begin{aligned}
& \text { Grade stress Level }= \\
& \mathrm{S}-2 \\
& \mathrm{~A}= \mathbf{3 . 8 5 4} \\
& \mathrm{in}^{2} \\
&(\mathrm{KS})=0.825 \quad \mathrm{in}^{4} / \mathrm{ft}
\end{aligned}
$$

from tables (3.12)

$$
\begin{array}{cl}
\mathrm{I}= & 0.548 \\
\sqrt{1 b} / Q^{=} & 9.883 \mathrm{in}^{2} / \mathrm{ft}
\end{array}
$$

| $F_{b}=$ |  |  |
| :--- | :---: | :---: |
|  | $\mathbf{1 2 0 0}$ | psf |
| $F_{v}=$ | $\mathbf{1 4 0}$ | psf |
|  |  |  |
| $E=$ | $\mathbf{1 5 0 0 0 0 0}$ | psf |

from tables (3.14)

## Joists:

Select type of wood - from tables 3.3 to 3.8 (Appendix B), we can get the following values for Redwood
(Select-
Structural:

| $F_{b}=$ | $\mathbf{1 3 5 0}$ | psi | from table (3.3) |
| :--- | :---: | :---: | :---: |
|  |  |  |  |
| $F_{v}=$ | $\mathbf{8 0}$ | psi | from table (3.3) |
| $F_{c \perp}=$ | $\mathbf{6 5 0}$ | psi | from table (3.3) |
| $E=$ | $\mathbf{1 4 0 0 0 0 0}$ | psi | from table (3.3) |

| Temperature factor | $C_{t}=$ | $\mathbf{1 . 0} \quad$ from table (3.8) |  |
| :--- | :---: | :---: | :---: |
| Load duration factor |  | $C_{D}=$ | $\mathbf{1 . 2 5}$ rom table (3.7) |
|  |  | ( no splite |  |
| shear stress factor | $C_{H}=$ | $\mathbf{2}$ case ) from table (3.4d |  |

Choose (2*6) Redwood which has the following characteristics :(from table 3.2)

$$
\begin{array}{ccc}
\mathrm{A}= & 8.25 & \mathrm{in}^{2} \\
\mathrm{~S}= & 7.563 & \mathrm{in}^{3}
\end{array}
$$

| $\mathrm{I}=$ | 20.8 | $\boxed{\mathrm{in}^{4}}$ |
| :---: | :---: | :---: |
| $\mathrm{~d}=$ | 5.5 | in |
| $C_{f}$ | 1.2 |  |
| $\mathrm{~b}=$ | 1.5 | in |

| Temperature factor | $C_{t}=$ | $\mathbf{1 . 0}$ | from table (3.8) |
| :--- | :---: | :---: | :---: |
| Load duration factor | $C_{D}=$ |  | $\mathbf{1 . 2 5}$ |
| shear stress factor | $C_{H}=$ | $\mathbf{2}$ ( no splite case from table (3.4d) |  |

Choose (2 *6) Redwood which has the following characteristics :(from table 3.2)

| $\mathrm{A}=$ | 8.25 | $\mathrm{in}^{2}$ |
| :--- | :---: | :---: |
| $\mathrm{~S}=$ | 7.563 | $\mathrm{in}^{3}$ |
| $\mathrm{I}=$ | 20.8 | $\mathrm{in}^{4}$ |
| $\mathrm{~d}=$ | 5.5 | in |
| $C_{f}$ | 1.2 |  |
| $\mathrm{~b}=$ | 1.5 | in |

Shore:

| Bearing Area Factor $=$ | $\mathbf{1 . 2 5}$ | from table (3.9) (b=1.5 in) |
| :---: | :---: | :---: |
| Temperature Factor $=$ | $\mathbf{1 . 0}$ | from table (3.8) |

### 4.3.2 Design Load on formwork

Weight of concrete (Ib./cubic foot) $=$\begin{tabular}{|c|}
98.75 <br>
weight of formwork (Ib./cubic foot)

$=$

5 <br>
Dead Load (Ib/cubic foot) $=103.75$
\end{tabular}

Live load (Ib/cubic foot)

Figure (4.5): Slab Form Components

### 4.3.3 Design of Sheathing

* Consider 1-ft strip. It carries a load of $=178.75 \mathrm{ib} / \mathrm{ft} 2$

From table 3.15, using 3 or more spans :

## Bending :

Shear :

$$
l_{2}=154.81 \mathrm{in}
$$

## Deflection :

$$
\begin{gathered}
l_{3}^{3}=22226.57 \\
l_{3}=28.12 \mathrm{in} \\
\text { Joists spacing }=25.70 \mathrm{in} \\
\text { Joists spacing }=2.056 \mathrm{ft}
\end{gathered}
$$

### 4.3.4 Design of stringer

Load on a stringer is $=1010.79 \mathrm{ip} / \mathrm{ft}$

## Bending :

$$
\begin{aligned}
\boxed{F_{b}^{\prime}} & =2025 \mathrm{psi} \\
\boxed{\boldsymbol{l}} & =79.45 \mathrm{in} \\
& =6.36 \mathrm{ft}
\end{aligned}
$$

Shear :

$$
\begin{aligned}
\boxed{l} & =\quad 71.764 \mathrm{in} \\
& =\quad 5.74 \mathrm{ft}
\end{aligned}
$$

## Deflection :

$$
\begin{aligned}
\boxed{l} & =85.70 \mathrm{in} \\
& =6.86 \mathrm{ft} \\
\text { Stringer spacing } & =5.741 \mathrm{ft}
\end{aligned}
$$

### 4.3.5 Design of joists

Load / ft of joist $=\quad 367.537 \mathrm{Ib} / \mathrm{ft}$

## Bending :

$$
\begin{array}{|lll}
F_{b}^{\prime} & 2025 & \mathrm{Ib} / \mathrm{ft}
\end{array}
$$

From Table 3.16

$$
\begin{array}{rll}
l & = & 70.70826 \mathrm{in} \\
& = & 5.675 \mathrm{ft}
\end{array}
$$

Shear :
$F_{v}=200 \quad \mathrm{psi}$

$$
l \quad=70.70826 \quad \text { in }
$$

$$
=\quad 5.657 \mathrm{ft}
$$

## Deflection :

$$
\begin{array}{lll}
\boxed{l} & 72.55825 & \text { in } \\
= & 5.80 & \mathrm{ft}
\end{array}
$$

span of joists $\square$ ft

### 4.3.6 Design of Shore

## Check for crushing (joist on stringer) :

force transmitted from joist to stringer is equal to load of joist/ft multiplied by the span
of the joist,
force $=2078.33 \mathrm{Ib}$
Area through which this force is transmitted

$$
=
$$

Crushing stress $=\quad 461.851 \mathrm{Ib} / \mathrm{in}^{2}$
from Table 3.6a, we get the following properties :

| $F_{c \perp}=$ |  | 650 | $\mathrm{Ib} / \mathrm{in}^{2}$ |  |
| :---: | :---: | :---: | :---: | :---: |
| Bearing area factor= |  | 1.25 | rom table 3.9 |  |
| Temperature factor $=$ |  | 1.0 | from table 3.8 |  |
| $F_{c \perp}^{\prime}$ | 812.5 | psi | safe | in |

## Shore strength

Required shore spacing $=($ stringer span $)$
Shore strength $=$ span of stringer $*$ load of stringer

$$
=5803.04 \mathrm{Ib}
$$

Jo we use shores strength is larger than 5804 Ib

### 4.4 Distribution of Joist \& Stringers:

### 4.4.1 Distribution of Joist For length 13.5m (Figure4.1):

Joist spacing $=2.056 \mathrm{ft} / 3.28=0.626 \mathrm{~m}$
Span 5 m (net span $=\mathbf{4 . 7} \mathbf{~ m}$ )
No of joist $=4.7 / 0.626=7.5$ joists
Spacing between joist $=4.7 / 7.5=0.63 \mathrm{~m}$
Span 4.25 m (net span $=\mathbf{3 . 9 5} \mathbf{~ m}$ )
No of joist $=3.95 / 0.626=6.3$ joists
Spacing between joist $=3.95 / 6=0.66 \mathrm{~m}$

### 4.4.2 Distribution of Stringers For length 17 m (Figure4.1):

Stringers spacing $=5.741 \mathrm{ft} / 3.28=1.75 \mathrm{~m} \approx 2 \mathrm{~m}$
Span 4 m (net span $=\mathbf{3 . 7} \mathbf{~ m}$ )
No of Stringers $=3.7 / 2=1.85 \approx 2$ Stringers
Spacing between Stringers $=3.7 / 2=1.85 \mathrm{~m}$
Span 4.25 m (net span $=\mathbf{3 . 9 5} \mathbf{~ m}$ )
No of Stringers $=3.95 / 2=1.97 \approx 2$ Stringers
Spacing between Stringers $=3.95 / 2=1.97 \mathrm{~m}$
Span 4.75 m (net span $=\mathbf{4 . 4 5} \mathbf{~ m}$ )
No of Stringers $=4.45 / 2=2.2 \approx 3$ Stringers
Spacing between Stringers $=4.45 / 3=1.48 \mathrm{~m}$

### 4.5 Desiccation

* Design for 1ft strip
* Design Load for square foot of decking $=178.75 \mathrm{Ib} / \mathrm{ft}^{2}$
* The type of Sheathing sanded panels $(4 \times 8 \mathrm{in}) \& t_{\text {ick. }} \frac{1}{1 / 8}$ in
* $\quad$ The safe spacing of Joist $=2.056 \mathrm{ft}$
* No of Joist for length 13.5 m figure $4.1=20$ Joists
* Select joist type Red wood (select- structural) carry load $=367.537$ Ib/ft
* $\quad$ Select stringers $(2 \times 8)$ tow stringer. carry Load $=1010.79 \mathrm{Ib} / \mathrm{ft}$ and spacing $=5.74 \mathrm{ft}$
* No of Stringers for length 17 m figure $4.1=9$ Stringers
* Force on Shore $=2078.33$ Ib \& shore spacing $=$ stringers span

Table (4.1): Comparison between Manual Design \& Design by
Excel

|  | Manual Design | Design by Excell |
| :---: | :---: | :---: |
| Design Load | $178.75 \mathrm{Ib} / \mathrm{ft}$ | $178.75 \mathrm{Ib} / \mathrm{ft}$ |
| Sheathing | $\begin{aligned} & \text { Load }=178.75 \mathrm{Ib} / \mathrm{ft} \\ & \text { Joist Spacing }=2.056 \mathrm{ft} \end{aligned}$ | $\begin{aligned} & \text { Load }=178.75 \mathrm{Ib} / \mathrm{ft} \\ & \text { Joist Spacing }=2.056 \mathrm{ft} \end{aligned}$ |
| Joist | Load $=367.51 \mathrm{Ib} / \mathrm{ft}$ <br> Span of Joist $=5.654 \mathrm{ft}$ | Load $=367.537 \mathrm{Ib} / \mathrm{ft}$ <br> Span of Joist $=5.655 \mathrm{ft}$ |
| Stringers | $\begin{aligned} & \text { Load }=1010.651 \mathrm{Ib} / \mathrm{ft} \\ & \text { Stringer Spacing }=5.74 \mathrm{ft} \end{aligned}$ | $\begin{aligned} & \text { Load }=1010.79 \mathrm{Ib} / \mathrm{ft} \\ & \text { Stringer Spacing }=5.74 \mathrm{ft} \end{aligned}$ |
| Shore | Force $=2077.90 \mathrm{Ib}$ <br> Cruching stress $=461.75 \mathrm{Ib} / \mathrm{in}^{2}$ <br> Shore Strength $=5801 \mathrm{Ib}$ | Force $=2078.33 \mathrm{Ib}$ <br> Cruching stress $=461.851 \mathrm{Ib} / \mathrm{in}^{2}$ <br> Shore Strength $=5803 \mathrm{Ib}$ |
