

DEDICATION

To

My father

. . . My mother

. . . My brothers and sisters

. . . My husband

To My lover Talia

To my uncle Abdel Hafiez

And

To My friends

i

ACKNOWLEDGEMENT

Thanks to *Allah* for enabling me to get to where I am today, to have guided me and bestowing his mercy and blessings upon me and

my family. I humbly raise my hands and say *Al-Hamdu-Lillah* to Allah for everything.

I would like to express my deep and sincere gratitude to my supervisor, Dr. Ishraga Ahmed Fargalla, Head of the Department of pathology, faculty of medicine, University of Alzaiem Alazhari. Her unlimited knowledge and her logical way of thinking have been of great value to me. Her understanding, encouraging and personal guidance have provided a good base for this thesis. Last but not least her detailed and constructive comments provided important support throughout this work.

I wish to express my warm and sincere thanks to my colleague Khalid Mubark, department of histopathology in Fidel Hospital, for his great help to me to accomplish this work.

I warmly thank Austaz Musa Omer Musa and colleague Ali Ibraheim Ali, for their valuable advice and friendly attitude. Their extensive discussions around my work and interesting explorations in operations have been very helpful for this study.

My warm thanks to Iobna Mohamed Alhassan, Baheri hospital her kind support and guidance have been a good addition to this study.

I wish to thank my colleagues Dalia Mohamed Osman for her guidance in statistical analysis, and Sabah, Nada, and Jomana in histopathology laboratory of Ishraga Ahmed Fargalla for their essential assistance in reviewing the patient files of this study. During this work I entertained the collaboration of many colleagues for whom I have great and hearty regards. Finally I wish to extend my warmest thanks to all those who helped me to get through with this research in the Department of Histopathology at Alzaiem Alazhari and Sudan Universities.

ABSTRACT

This retrospective study was conducted in histopathology laboratories in Bahry hospital and fideal hospital, and laboratory of Dr. Ishraga Ahamed Fargalla, during the period from April to August 2011. This study aimed to detect the different types of mucins in adenocarcinoma of the large bowel. 67specimens from adenocarcinoma of large bowel were stained by six histopathological special stains to detect types of mucins and to correlate histological types and grade of the tumor with mucin type.the Haematoxylin and Eosin (H&E) for general morphology, and periodic acid schiff's reagent for neutral mucin and N-acetyl sialomucin(enzyme labile),variable for sulfated and negative for O-acetylsialomucin(enzyme resistant),and Phenylhydrazine-PAS stain which is negative for neutral mucin and positive for other periodate-reactive mucins, and combined alcian blue-PAS stain which is differentiated between acid and neutral mucin, and combined aldehyde fuchsin-alcian blue stain to differentiate between sulfated and carboxylated mucin, and alcian blue stain PH1for weakly sulfated mucin. The study concluded that: The type of mucin found in this study, carboxylated sialomucin Oacetytle was the majority type 22 (32.80%), followed by carboxylated sialomucin N acetyl form 19 (28.40%), neutral mucin and carboxylated sialomucin were found in 12 (17.90%), and neutral and sulfated mucin in 6 (9.0%), while sulfated mucin in 4 cases(6.0%) and neutral and acid mucin in 4 cases also.The histological types of tumor are mucinous adenocarcinoma, non mucinous adenocarcinoma and signet ring type, distributed as 9(13.4%), 52(77.6%), 6(9.0%) respectively. The histological grade of tumor distributed as well differentiated 17(25.40%), moderately differentiated 38(56.70%) and poorly differentiated 12(17.90%). Finally we recommended conducting new studies contributing larger sample size

and using more specific and sensitive techniques to identify different types and subtypes of mucins.

الخلاصة

أجريت هذه الدراسة بأخذ عينات من مختبر أمراض الأنسجة والخلايا بمستشفى فضيل ومستشفى بحري ومختبر د. اشراق أحمد فرج الله في الفتره من ابريل حتي أغسطس 2011. هدفت الدراسة إلي الكشف عن نوع المادة المخاطية الميوسين الموجودة في سرطان الأمعاء الغليظة . تم جمع 67 عينة من عينات محفوظة مسبقا في شمع البرافين مأخوذة من مرضي سرطان الامعاء. تم صبغ العينات النسيجية بست طرق مختلفة لمعرفة نوع الكربوهيدرات الموجود : طريقة الهيماتوكسيلين و الإيوسين لإظهار الشكل العام و التغيرات النسيجية وطريقة حمض البريوديك شيف لإظهار كل انواع الميوسين وطريقة البريوديك شيف مع الفينايك هايدروزيان للتأكد من نوع الميوسين المتعادل وطريقة البريوديك شيف مع الالسين بلو للتفريق بين الميوسين المتعادل والميوسين الحمضي وطريقة البريوديك شيف مع الالدهيد فوكسين للتفريق بين انواع الميوسين الحمضي السلفيت والكربوكزوليت وطريقة الالسين بلو بمقياس هيدروجيني 1 لمعرفة الميوسين الحمضي من نوع السلفيت. أظهر التقييم النسيجي للذين شملتهم الدراسة النتائج التالية: 22 (32.8%) ميوسين حمضي كربوكسيل (و) اسيتايل و 19 (28.4%) ميوسين حمضي كربوكسيل (ن) اسيتايل و 12 (17.9%) ميوسين حمضي متعادل مع ميوسين حمضي كربوكسيل و 6 (9.0%) ميوسين حمضي متعادل مع ميوسين حمضي سلفيتي و 4 (6.0%) ميوسين حمضي سلفيتي و 4 (6.0%) ميوسين حمضي متعادل. ووجد ان نسبة انواع سرطان المعاء الغليظة كالاتي السرطان المخاطي 9(13.4%)، والغير مخاطي 52 (77.6%)، والنوع الحلقي 6 (9.0%). كما وجد ان السرطان واضح التفريق بنسبة 17(25.40%)، والمتوسط التفريق بنسبة 38 (56.70%)، والفقير التفريق بنسبة 12 (17.90%) . واوصت الدراسة بإجراء دراسات جديدة تشمل عدد اكبر من العينات وباستخدام تقنيات أكثر دقة وحساسية للتعرف على أنواع مختلفة من الميوسين وأنواعه.
