Dedication

**I would like to dedicate this
research
to all those who always
have been there for me.
To my Father and mother
To my wife and kids ..
With much love**

Osama

Acknowledgment

First of all, thanks for Allah who gave me the power for preparation and completion of this study.

With a great deal of respect I would like to express my thanks to my supervisor Dr. Mugahid M. El hassan, Head of Microbiology Department, College of Medical Laboratory Science, Sudan University of Science and Technology for his advice, enthusiasm, help and endless guide.

My thanks are extended to my colleagues for their kind support and their beautiful friendship.

I would also like to thank my old and little family for their patience and support.

Abstract

This study aimed to determine antimycolic acid antibodies [IgG and IgM] among TB/HIV Co-infected patients in Khartoum State.

Sputum and blood specimens were collected from patients attended to Alsha'ab Teaching Hospital, Tuberculosis Reference Laboratory, Ibrahim Malik Hospital and Abu Anga Hospital, patients were all ready informed.

Direct smears from 90 sputum of suspected patients showed that 17 (18.9%) were acid fast bacilli, while 73 (81.1%) were non acid fast. The ninety sputum specimens were subjected to PCR to amplify IS6110. The result showed that 79 (87.8%) were positive for IS6110 while 11 (12.2%) were negative.

The 90 serum samples were investigated for HIV using dot blot technique, were 9 samples (10%) were found HIV positive and they were all TB positive by PCR.

80 Serum samples were analysed by ELISA, 16 (20%) gave positive result for antimycolic acid IgG while 64(80%) were negative and 55 (68.8%) were positive for antimycolic IgM, while 25(31.3%) were negative. In correlation between HIV and antibodies for antimycolic acids, in 6 HIV positive samples one (31.3%) was positive and 5 (6.3%) negative samples for IgG, and in correlation between HIV and IgM, in the 6 HIV positive

there were 2 (2.5%) IgM positive and 4 (5%) IgM negative samples.

This study concluded that patients with TB/HIV Co-infection have less antimycolic acids antibodies.

ملخص الدراسة

هدفت هذه الدراسة للتعرف علي الاجسام المضادة من فصيلة IgG و IgM الخاصة لحمض المايكوليك لدى المرضى المصابون بالسل الرئوي المصاحب لمرض نقص المناعة المكتسبة بولاية الخرطوم.

جمعت عينات الدم و التفاف من مستشفى الشعب التعليمي ومعمل الدرن المرجعي ، مستشفى ابراهيم مالك ومستشفى أبو عنجة. المرضى تم إعلامهم بهذه الدراسة.

المسحات التي أخذت من 90 عينة تفاف تم صبغها بالذهل نيلسن 17 (18.9%) وجدت موجبة و 73 (81.1%) سالبة. أما من جملة الـ 90 عينة تفاف التي تم فحصها باختبار البلمرة التسلسلي وجد أن 79 (87.8%) كانت موجبة و 11 (12.2%) سالبة. 90 عينة دم تم فحصها لمرض المناعة المكتسبة بطريقة الاختبار المناعي بتقنية الفصل النوعي ، 9 عينات (10%) كانت موجبة. العينات الموجبة لمرض نقص المناعة المكتسبة كلها كانت موجبة لمرض السل الرئوي عندما تم فحصها عن طريق اختبار البلمرة التسلسلي.

80 عينة دم تم تحليلها بواسطة الاختبار المناعي المرتبط بالانزيم وجد 16 (20%) عينة كانت موجبة للجاما قلوبولين و 64 (80%) كانت سالبة. اما اختبار الاميونوكلوبولين ام كانت 55 (68,8%) موجبة و 25 (31,3%) سالبة. أما عندما أجريت المقارنة مع المرضى المصابين بمرض نقص المناعة المكتسبة من بين 6 مصابين بمرض نقص المناعة المكتسبة وجد شخص واحد موجب الجاما قلوبيلين وذلك يعزى للنقص الشديد في الأجسام المضادة في الدم. بينما وجدت عيتان موجبتان

للقلوبيولين المناعى M مقابل اربعة عينات سالبة من اصل 6
عينات تم إجراء الاختبار المناعي المرتبط بالإنزيم لها.
لقد وضح لنا في هذه الدراسة أن المرضى الذين يعانون من
مرض نقص المناعة المكتسبة يقل عندهم أجسام مضادة لحمض
المايكوليك الموجودة في العصيات السلبية للسل الرئوي.
