Dedication

To:

My family,

Teachers,

&

Colleagues.
Acknowledgement

My grateful thank to Dr. Hussain Gad Elkarim Ahmed, for his close supervision.

My gratitude extends to Ustaz: Abd Alla Hassb Alnabi for his technical support.

My gratitude extends to the staff of the Histopathology and Cytology Department at the Radio Isotope hospital and the Police Hospital.

My thankful to my family for encouragement and support.

As well my thankful to my colleagues.
ABSTRACT

This is a descriptive prospective study to assess the cellular proliferative activity in thyroid fine-needle aspiration (FNA) materials. The study was conducted in Khartoum during the period from November 2008 to March 2009. FNA Materials, were obtained from 50 patients (46 females and 4 males), with thyroid palpable lumps. Their ages ranging from 19 to 85 years with a mean age of 40 years old.

The diagnoses of the 50 thyroid FNAs were as follows: 3 (6%) were smears showing atypical cell, 9(18%) were showing thyroid hyperplastic cells, 34(68%) were found with normal thyroid cells and 4 (8%) were identified as non-representative smears.

All of the nine smears that were taken from the patients with thyroid hyperplasia and one smear from a patient with atypical thyroid cells, have showed intense DNA staining (++) by Feulgen staining method. All smears that were diagnosed as containing normal thyroid cells 34(68%) and 2 (4%) of those showing atypical thyroid cells had mild staining intensity.
ملخص الدراسة

هذه دراسة وصفة مستقبلية تقوم نشاط التكاثر الخلوي في عينات الرشف بالبر الرفيعة من الغدة الدرقية.

أجرت هذه الدراسة في الخرطوم في الفترة بين نوفمبر 2008 وحتى مارس 2009م.

أخذت عينات الرشف بالبر من خمسين مريضًا يعانون من تضخم الغدة الدرقية منهم 46 إناث و 4 ذكور. كانت أعمارهم تتراوح بين 19 و 85 عامًا. بمتوسط عمري 40 عامًا.

كان التشخيص ل 50 عينة من الغدة الدرقية على النحو التالي: 3% (6) أظهرت نمو غير نمطي لخلايا الغدة الدرقية, 18% (9) أظهرت فرط تنسج خلايا الغدة الدرقية (34% (68%)) كانت من خلايا الغدة الدرقية الطبيعية (8%) ووجدت أنها مسحات غير مستوفية.

كل من التسع مسحات التي أخذت من المرضى المصابون بفرط تنسج خلايا الغدة الدرقية و واحدة من مسحات المرض المصابون بنمو غير نمطي لخلايا الغدة الدرقية أظهرت كثافة صبغية للـDI ات إيجابية (+) باستخدام تفاعل الفلوجين. وأوضحت أن كل المسحات التي شخصت
علي أنها تحتوي خلايا الغدة الدرقية الطبيعية 34(68%) و 2(4%) من
اللات اظهرن نمو غير نمطي لخلايا الغدة الدرقية أظهرت كثافة صبغية
ضعيفة .

## Chapter One

### Introduction

1

## Chapter Two

2. **Review of Literature**

2.1 Scientific background 5
2.2 Thyroid hyperplasia 5
2.3 Thyroid cancer epidemiology 6
2.4 Etiology of thyroid cancer 7
2.5 Diagnosis of thyroid cancer 8
2.6 Management of thyroid hyperplasia and thyroid cancer in relation to early detection 10
2.7 Techniques used in assessment of proliferative activity 11

Chapter Three

3. Materials and Methods 14
3.1 Study design 14
3.2 Study area 14
3.3 Study Population 14
3.4 Ethical Consideration 15
3.5 Fine needles aspiration 15
3.6 Smear Preparation 15

Chapter Four

4. Results 18

Chapter Five

5. Discussion 28

Conclusion and Recommendations 31
