DEDICATION

To my

Family,

Friends,

And

City

(ii)

Acknowledgements

I would like to express my deep thanks to **Dr. Elmugdad Ahmed Ali Khalid** for his close supervision, guidance and encouragement throughout the period of my study. Great thanks to **Dr Mohamed Adam Abu Hussein** for his continuous, numerous assistance which has clear reflection in this work.

Finally, I would like to express my sincere thanks to the Merowe Dam, Hospital, Water station, college, people, and chemistry Department, Faculty of Science, Sudan University of Science and Technology.

Abstract

The study was done to investigate the drinking water quality of Merowe city distributed the pipe line of water net work seven sites of the city water net work were selected comprising raw water Nile, Two hundred and sixteen samples were collected during the period August 2008-June 2009.three samples monthly collecting from each site to evaluate each parameter examined in this study. Samples were subjected to physical, chemical, microbiological and radio- activity examination and analyzed to investigate the level of the expected health hazards in each sample. The data obtained were subjected to statistical analysis. The results obtained were compared with international and national drinking water guide-lines in an attempt to evaluate the quality of drinking water in Merowe city.

The results obtained indicated that the turbidity level ranged from (32.93-11.42 NTU) thus exceeding the permissible level of international standards WHO (1993) and Sudanese standards and metrology organization (SSMO) standards (5 NTU).

The concentration range of minerals such were as follows: chloride (8.71 -3.25 mg/dm³)sulfate (22.92 - 3.23 mg/dm³), calcium (27.23 -12.20 mg/dm³), alkalinity (100 - 60mg/dm³), fluoride(3 - 0.02 mg/dm³),

magnesium (10.75 - 4.49 mg/dm³), TDS (167.13-101.56 mg/dm³), hardness (109 - 52.96 mg/dm³), sodium (16-27-9.14 mg/dm³), potassium (5.71 - 2.73 mg/dm³) iron (0.42 - 0.11 mg/dm³) nitrate (14.90 - 8.47mg/dm³), nitrite (6.35 - 0.26mg/dm³), electrical conductivity (310 - 138 mg/dm³), T.S.S (34.76 - 6 - 12 mg/dm³), pH (9.01 - 7.21 mg/dm³). All these values fall below the maximum values stated by WHO and (SSMO).

During this study period there were 309 people in Merowe city suffering from typhoid, 116 with Para typhoid, 654 with Diarrheal diseases city, 2707 with malaria and 268 with Essential hypertension and 434 with Diseases of oral cavity and 114 with Mucosa's of skin.

All of these diseases could be water-related although other environmental

(iv)

factors may also be important.

The study revealed that raw water of Merowe city was polluted by coli form and the results do not cope with international (WHO, 1993) and the national Sudanese standards metrology organization (SSMO, 2002).

After treatment of raw water the pollution incidence in tap water samples was decreased, however, slight pollution occurs in some of treated water sample.

It may be stated that most of the tap water sample collected from the main distribution net work are, suitable for human

consumption a number of recommend actions were suggested to improve the drinking water quality.

((v

ملخص البحث

أُجريت الدراسة على مياه الشرب لمدينة مروي بواسطة شبكة مياه المدينة في الفترة من أغسطس ٢٠٠٨ إلي يوليو ٢٠٠٩) وقد اختيرت ستة مواقع من المدينة على حسب توزيع شبكة مدينة مروي وأُجريت عليها التحاليل الفيزيائية الكيميائية

والميکرو بیولوجیة للتأكد من صلاحية المياه بالنسبة للاستهلاك الآدمي.

تم جمع 260 عينه من سبعه مواقع (النهر- الماء الخام داخل محطة المياه - حي التعمير- حي السوق - حي الثورة - حي الدومة - حي ابو دوم) يتم جمع ثلاثة عينات كل شهر من كل موقع ثم اختباره لمدة عام واجري عليه التحليل الإحصائي .

تمت مقارنة النتائج بالخصائص العالمية والمحليه لتقيم صلاحية المياه للشرب بمدينة مروي ووجدت أن معظم العينات المختارة تعتبر صالحه للاستعمال الآدمي .

لقد أوضحت الدراسة أن مستوى العكاره للستة مواقع تتراوح ما بين (11.24-30.93) والنتيجة لا تتفق مع خصائص منظمة الصحة العالمية (1993) وهيئة المواصفات والمقياس السودانية للعام (2002) وهي (5) وأظهرت الدراسة أيضاً أن نسبة تركيز الكلور تتراوح بين (3,25-8,71) والكبريتات تتراوح ما بين (3,23-22,92) ملجم\دسم ^٣) والكالسيوم ما بين(12,20-27,23) ملجم\دسم ^٣) القلوية ما بين (100-60 ملجم\دسم ^٣) والماغنيزيوم ما بين(4,49-101,56 ملجم\دسم ^٣) والأملاح الكلية ما بين (167.13-52.96 ملجم\دسم ^٣) وعسر الماء ما بين (109.00-16.27 ملجم\دسم ^٣) والحديد (0.42-0.11 ملجم\دسم ^٣) والصوديوم (9.14-5.71) والبوتاسيوم (2.73-2.71) ملجم\دسم ^٣) والنترات ما بين (8.47-14.90 ملجم\دسم ^٣) والنتريت ما بين (0.26-6.35 ملجم\دسم ^٣) والموصليه الكهربائيه ما بين (310.00-138.14) (vi).

ملجم\دسم ^٣) والفلور ما بين (0.20-3.00 ملجم\دسم ^٣) والرقم الهيدروجيني ما بين (7.21-9.01) وقد وجد إن كل العناصر كانت اقل من الحد الأقصى المسموح به في مواصفات كل من منظمة الصحة العالمية (١٩٩٣) وهيئة المواصفات والمقياس السودانية للعام (٢٠٠٢م).

وقد وجدت الدراسة إن حوالي 364 مصابون بمرض الالتهاب المعوي أثناء فترة الدراسة و 2707 مصابون بالملاريا و 268 بالكوليرا و 309 بالتاييفويد و 654 بالدستاريا و 268 بارتفاع ضغط الدم و 434 بأمراض الأسنان و 114 بأمراض جلديه

وكل الأمراض السابقة يمكن أن تكون متعلقة بالماء بالرغم من وجود العوامل البيئية الاخرى ، بعد معالجة الماء قلت نسبة التلوث في المياه تحت الاختبار ولكن ظهرت نسبة التلوث البكتيري لبعض المواقع بعد دخولها الشبكة العامة.

لقد أوضحت الدراسة أن معظم العينات المختارة من الشبكة العامة لمدينة مروي صالحه للاستهلاك الآدمي
