

*DEDICATION*

To my beloved family  
My parents,  
Ismail  
Safaa  
Alaa  
Mohammed  
  
Fatima

## *Acknowledgement*

Praise be to Allah the Merciful, the compassionate. Had it not been due to His will and help, this work never been possible.

My gratefulness and appreciation to Dr. Ahmed Khalil Ahmed for his guidance, supervision and support throughout the course of study.

I would like to express my great thanks, sincere appreciation and deep gratitude to Prof. Amera Hussian Hamra, the Co-supervisor, who patiently corrected and reformed this work with the dedication of a true scientist.

I would like to thanks Dr. Ismail Fagiri who suggested the research project and encouraged me to register for this degree.

I would like also thank Dr. Faisal Awawda of AAAID for his strong support to avail the animals for the experiment in this respect.

I would like also to thank Dr. Ibrahim Ahmed of Azaheer Company and Dr. Faisal Hassan for their strong financial support.

I should also mention here my great appreciation to the work done by Dr. Mohamed Kheir A.. Ahmed of University of Khartoum in the statistical analysis of data and Dr. Sharaf Eldin Makkawi for strong academic support. Also thanks extended to Prof. Hassan Suliman Ibrahim and Dr. Amna El-Sobiki for correcting the transcript.

I will never be able to express my thanks to my colleagues, Hassan Muhielin, Elsir Abdelhadi, Abass Abdelgadir and the worker Sulum Elnur of ACAPP.

I would like also to show my gratitude to Mr. Abdelhamed Abdelrahim, who patiently typed and revised the transcript.

My great thanks and appreciation to the staff of Animal Production department and to my dear colleagues Samia Mohamed A.. Rahman for her help.

I should confess here that I could not have finished this work without the help of my sister Samia A.. Rahman Mohayad , who shouldered the responsibility of the household, my children, mother and father she had done a great job.

## **ABSTRACT**

The aim of this study was to investigate the possibility of using broiler manures as a cheap source of rumen degradable protein for raising Holstein Friesian heifers. In addition to study the effect of feeding chicken manures on some productive and reproductive performance of heifers.

Thirty heifer calves ranging between 2–3 month of age were chosen from the dairy herd of the Arab Company for Agricultural Production and Processing (ACAPP). They were divided into two equal groups, offered concentrates and roughages from weaning until the age of 15 – 17 months.

The control group was fed on the farm conventional ration, which consisted of wheat bran 32 %, groundnut cakes 10%, sorghum grains 40%, molasses 15%, lime 2 %, and sodium chloride 1% with 16.6% C.P. and energy 11.98 MJ/kg DM. While, the experimental group was fed on 30% poultry manures ration, which was introduced gradually within a two weeks adaptation period. The ration consisted of poultry wastes 30%, groundnut hulls 7%, sorghum grains 50%, lime 2% and sodium chloride 1 % with 16.79 % C.P and ME 11.21 MJ/kg DM.

Some of the productive and reproductive performance was recorded as follows:

1. The mean final live weight of the control group was  $241.9 \pm 1.28$  kg and of the treatment group was  $234.77 \pm 1.36$  kg. These means were significantly different ( $P < 0.01$ ).
2. The mean daily gain for the control group was  $0.78 \pm 0.02$  kg. While for the experimental groups was  $0.76 \pm 0.03$  kg. Differences were not significant ( $P > 0.05$ ).
3. Age and weight at puberty for the control group were  $292.13 \pm 7.78$  day and  $233.4 \pm 5.4$  kg while for the treatment group was  $297.33 \pm 7.78$  day and  $239.00 \pm 5.40$  kg. Differences were not significant ( $P > 0.05$ ).
4. Age and weight at successful service for the control group was  $456.60 \pm 3.10$  day and  $343.2 \pm 4.9$  kg while the results for the experimental group was  $454.2 \pm 4.9$  day and  $253.00 \pm 4.9$  kg. Differences were not significant ( $P > 0.05$ ).
5. Number of services/conception for the control group is less than the experimental group they were  $1.2 \pm 0.13$  and  $1.7 \pm 0.13$  respectively with a significant difference ( $P < 0.05$ ).
6. Gestation length for the control group was  $275.8 \pm 1.3$  day while for the treatment group was  $277.00 \pm 1.34$  day. Difference was not significant ( $P > 0.05$ ).
7. Age at first calving for the control and treatment groups were  $730.4 \pm 3.81$  and  $741.86 \pm 3.81$  day respectively, with a significant difference ( $P < 0.05$ ).

8. Birth weights of newly born calves for the control and treatment groups were  $32.8 \pm 1.03\text{kg}$  and  $31.17 \pm 0.95 \text{ kg}$ , respectively without significant difference ( $P > 0.05$ ).
9. Mean milk yield for the first hundred days for the control group was  $1637.27 \pm 130.89$  litre while for the treatment group was  $1730.03 \pm 107.73$  litre with no significant difference ( $P > 0.05$ ).

Estimation of economical advantage of feeding poultry manure indicated that, the cost of growing the experimental group is less by 28% from the cost of the control group.

This study ended without any harmful effects of health hazards. In conclusion, feeding poultry manure up to 30% in growing heifers dairy heifers was practical, economic and without any significant side effect on production, reproduction and health of animals.

## بسم الله الرحمن الرحيم

### خلاصة الأطروحة

أجريت هذه الدراسة بغرض البحث في تغذية العجلات النامية في مزارع الألبان باستخدام بدائل علفية ذات قيمة غذائية جيدة وبتكلفة أقل كمخلفات الدواجن وأثرها على بعض الصفات الإنتاجية والتناسلية. وقد استخدم في هذه الدراسة (30) عجلة فطيمة تتراوح أعمارها ما بين 2 - 3 شهور من مزرعة الشركة العربية لإنتاج والتصنيع الزراعي والتي تمتلك أبقار من سلالة الهولستين فريزيان. وقد تم تقسيمها إلى مجموعتين متساويتين وتمت تغذيتها على المركزات والأعلاف الخضراء من الفطام وحتى عمر 15- 17 شهر.

وقد غذيت مجموعة الشاهد بعلائق المزرعة التقليدية والتي تتكون من ردة القمح 32%، أمبار الفول السوداني 10%، وحبوب الذرة 40% والمولاس 15% والحجر الجيري 2% وملح الطعام 1% وتحتوي على 16.6% من البروتين الخام وطاقة مقدارها 11.98 ميغاجول / كيلوجرام.

أما مجموعة التجربة فقد تم إدخال مخلفات الدواجن تدريجياً لمدة اسبوعين كفترة انتقالية بنسبة 30% كبديل لأمبار بذرة الفول السوداني حيث تكونت العليقة من الآتي: مخلفات الدواجن اللاحمة 30% وقشرة الفول السوداني 7% وحبوب الذرة 50% والحجر الجيري 2% وملح الطعام 1%. وتحتوي على بروتين خام بنسبة 16.79% وطاقة قدرها 11.21 ميغاجول/كيلوجرام وقد أوضحت النتائج المتعلقة ببعض الصفات الإنتاجية والتناسلية كما يلي:

1. معدل الوزن الحى النهائى كان  $1.28 \pm 241.49$  كجم لمجموعة الشاهد ولمجموعة التجربة  $1.36 \pm 234.77$  كجم وكان الفرق معنوياً ( $P < 0.01$ ).
2. مقدار الزيادة الوزنية اليومية  $0.03 \pm 0.78$  كجم لمجموعة الشاهد أما فى مجموعة التجربة فكانت  $0.03 \pm 0.76$  كجم وكان الفرق غير معنوي ( $P > 0.05$ ).

3. بلغ معدل العمر والوزن عند البلوغ لمجموعة الشاهد  $\pm 7.78$  و  $292.13$  يوم و  $5.4 \pm 233.40$  كجم أما لمجموعة المعاملة فقد بلغ  $7.78 \pm 297.33$  يوم و  $5.4 \pm 239.00$  كجم وكان الفرق غير معنوي ( $P > 0.05$ ).
  4. بلغ معدل العمر والوزن عند أول تلقيحه ناجحة لمجموعة الشاهد  $3.10 \pm 456.60$  يوم و  $4.9 \pm 343.2$  كجم بينما كان لمجموعة التجربة  $6.9 \pm 454.2$  يوم و  $4.9 \pm 253.2$  كجم وكان الفرق غير معنوي ( $P > 0.05$ ).
  5. وقد كان عدد مرات التلقيح اللازمة للإخصاب لمجموعات الشاهد اقل من مجموعة التجربة وهي كالاتي  $0.13 \pm 1.2$  و  $0.13 \pm 1.7$  على التوالي وكان الفرق معنوياً ( $P < 0.05$ ).
  6. بلغ طول فترة الحمل لمجموعة الشاهد  $1.3 \pm 275.8$  ليوم ولمجموعة التجربة  $1.3 \pm 277.0$  يوم وقد كان الفرق غير معنوياً ( $P > 0.05$ ).
  7. كما بلغ العمر عند الولادة الأولي لمجموعتي الشاهد والتجربة كالاتي:  $3.81 \pm 730.4$  يوم و  $3.81 \pm 741.86$  يوم على التوالي وقد كان الفرق معنوياً ( $P < 0.05$ ).
  8. أما أوزان المواليد لمجموعتي الشاهد والتجربة كانت كالاتي  $1.03 \pm 32.8$  كجم و  $0.95 \pm 31.17$  كجم على التوالي وكان الفرق غير معنوي ( $P > 0.05$ ).
  9. بلغ معدل اللبن للمائة يوم الأولي لمجموعة الشاهد  $130.89$  و  $1637.27 \pm$  لتر ولمجموعة التجربة  $107.73 \pm 1730.03$  لتر وقد كان الفرق غير معنوي ( $P > 0.05$ ).
- وعند حساب الجدوي الاقتصادية باستخدام فضلات الدواجن في تغذية العجلات النامية فقد إتضح أن تكلفة عجلات التجربة أقل عن تكلفة عجلات مجموعة الشاهد بنسبة 28% كما لم تلاحظ أي أعراض مرضية. من كل ما تقدم نستنتج أن استخدام فضلات الدواجن بنسبة تصل 30% من العليقة المركزة للعجلات النامية ذو فائدة إقتصادية وليس له تأثير سلبي على الصفات الإنتاجية والتناسلية والصحة العامة للحيوانات.
