

DEDICATION

To my dear parents

ACNOWLEDGEMENTS

I am truly grateful to all those who have supported me directly or indirectly throughout my master program. The support and guidance I received from thesis supervisor Dr. sarra Ahmed Mohmmed saad and co-supervisor Dr.Ahmed Eldoma during this was invaluable and greatly appreciated

I also wish to thank my family and acknowledge all their support and encouragement I would like also to thank Mr Elyas A. Mr Elyas and Miss Hinda baballa for their assistance and help in various ways .

Finally, I will remain eternally Allah for give me the power and energy to accomplish this work.

Abstract

The present work investigate the suitability of the discharged waste water from the Khartoum Refinery company (KRC) facility of Elgili located at about 73 km north of Khartoum .

The objective of the study is to dispose of the waste water discharge of Khartoum refinery using suitable tree crops.

Six different tree species are selected this tree is: *Acacia tortilis*, *Eucalyptus camadulensis*, *Azadirachta indica*, *Grewia tenax*, *Eugenia Jambolana* and *Conocarpus erectus*

Two experiments were conducted, the first experiment was a pot nursery experiment where the same six tree species were irrigated with either refinery waste water and tap water. The treatment was replicated three times.

The second was a field trial experiment, where six different trees species both indigenous and exotics were used (ACRBD). A design was used with four replications.

In addition a chemical and physical soil analysis was undertaken including water soluble cations and anions, pH, EEC, OC, total N content and particle size distribution water analysis for BOD, pH, EC soluble cations and oil content was performed Measurement from the field and nursery pot experiment included total pant height root collar diameter number of leaves and number of branches. Date collected was subjected to analysis of variance and the statistical method system.

Results showed highly significant differences between the tree species treated with discharged refinery waste water in the field trail. The most

tolerant species to refinery waste water were *Conocarpus erectus* and *Acacia tortilis* while the most sensitive was *Grewia tennax*

Generally the remainder of the species shows significant differences between them. Result from the nursery pot experiment followed the same trend in variation between the six tree species in addition to a significant variation between the two irrigation treatments.

The study recommends the planting of *Conocarpus erectus* and *Acacia tortillas* this for their tolerance to refinery waste water and their better performance and study and adaptation to the planting site

ملخص الدراسة

ملخص الدراسة

هذه الدراسة تبحث فى تقييم مدى ملاءمة التخلص من مياه النفط المعالجة من شركة مصفاة الخرطوم التى تقع على بعد 73 كلم تقريبا شمال الخرطوم لرى بعض أنواع الاشجار. حيث اجريت تجربتين، كانت الاولى تجربة الحضانات بالمشتل حيث تم إستخدام نوعين من المياه ، المياه المعالجة والمياه العادية فى ستة أنواع من النباتات تم أخذ القراءات لها فى ثلاث مناسبات ، التجربة الثانية تجربة حقلية إستخدم فيها نظام المربعات العشوائية الكاملة حيث تم إستخدام ستة أنواع من الاشجار المختلفه المحلية والمستجلبه على حده سواء ، مع اربع تكرارات .

بالاضافة الى ذلك تم إجراء تحليل كيميائى وأخر فيزيائى للتربة بما فى ذلك شوارد المياه الموجبة السالبة ، درجة الحموضة ، الكربون العضوى ، مجموع محتوى النتروجين ، حجم الجسيمات ، تحليل توزيع الاكسجين المطلوب كيميائيا، قوة التوصيل الكهربائى، أيونات الشوارد الموجبة للذوبان ومحتوي الزيت .

القياسات من الحقل والحضانات شملت الإرتفاع، القطر، عدد الأوراق، وعدد الأفرع . تم تحليل المعلومات التى جمعت بواسطة نظام علم التحليل الإحصائى اصدار 1996 م .

أظهرت نتائج انوفا فروقات إحصائية كبيره بين انواع الاشجار التى تم التعامل معها بواسطة المياه المعالجة، وكانت أكثر الأنواع تحملا هى الدمس السعودى والسيال بينما الأقل تحملا هى هو القصيم.

بصورة عامة أظهرت الأنواع الأخرى من الاشجار فروقات ذات دلالة إحصائية مختلفة. كما أظهرت النتائج عند إستخدام نوعين من المياه اختلافات متفاوتة بين انواع الاشجار الستة .

أوصت الدراسة بزراعة الدمس السعودى والسمر نسبة لإعطاءهما معدل نمو جيد عند إستخدام المياه المعالجة ولملاءمتهم للبيئة المحيطة بالمنطقة .
