DEDICATION

To my Father’s Soul

To my Mother

To my Brothers

To my Sisters

To my Colleague &

To my Friends
Maymouna

ACKNOWLEDGMENT

In the first thanks to my God, this work would not have been possible without the cooperation and assistance of many members I especially thank Dr. Yahya. Head of Bacteriology Division Lab – Institute of Veterinary Research, who has been a gracious and encouraging co-supervisor. I would like to express my special thanks to the supervisor Dr. Samia Hamid, for understanding.

Thanks are also given to my colleagues whom helped me to this work. I am greatly indebted to teacher and staff in wildlife & Fisheries Division – University of Sudan for Technology and Sciences, I am also thanks the staff of teacher whom teaching us in this courses and thanks the staff of technical in Institute Veterinary Research Lab for their help and support.

I would like to thanks the fishermen for their technical help. Thanks to colleagues in General Directorate of Animals Health and Epizootic Diseases Control and my colleagues in Division of Wildlif & Aquatic Animals. Thanks to all persons for their valuable help and allowing me their precious time for my post graduate study.

Finally my best gratitude for my mother, my brothers and my sisters for their unlimited support.

4. Detection of *Aeromonas salmonicida* by uses Api 20 NE system...(45)
5. Opening and abdominal cavity in Tilapia fish...........................................................(51)
6. Opening and abdominal cavity in Clarias fish..................................................................(51)
7. *Aeromonas spp* purification colonies on Nutrient agar..............................................................(52)
8. Utilization of an air bubble as positive reaction of catalase test...................................................(52)
9. Utilization of the colour as positive reaction of oxidase test....................................................(53)
10. Fermentative is positive result due to attacked sugar glucose test with produced gases on darham tube (right tubes) and not fermentative as negative result (left tube) ........................................................................... (53)

11. Pink colour (positive reaction), clear (negative result) and oxidation in open tube (oxidative result) from left to right tube is utilize the results on the Oxidation-Fermentation (OF) test. ........................................................................................................ (54)

12. An API 20NE strip after inoculation, incubation and the addition of reagents. The organism was a *Aeromonas hydrophyla*. ........................................................................................................ (54)

13. Red colour due to positive result in Nitrate reduced to Nitrite test. ........................................................................................................ (55)

14. Red rings due to positive result in indole test. ........................................................................................................ (55)
ABSTRACT

The aim of this study to detected to causative agent of bacterial fish septicaemia (*Aeromonaas sp* and *Pseudomonas sp*) and their prevalence in three seasons of years (winter, summer and autumn).

A total of 35 fish samples (19 Oreochromis niloticus and 16 clarias sp), the samples were taken from gills, skin, intestine, liver, stomach and kidney, collected from Jabal Awalia dam and Elshagera location (river Nile) and fish farm from Elshagera fish research center in the period December 2012 to June 2013.

The experiment was conduct in the institute of Veterinary Research Center, Bacteriology Divition, Suba, Khartoum State. Different methods of isolation of bacteria were used included conventional test and API 20NE kits.
The result obtained revealed that there were highly significant different between seasons of the year (p < 0.01) and different organs( p < 0.01) and significant different between Oreochromis niloticus and Clarias sp (p < 0.05 > 0.01) in the abundance of Aeromonas spp.

The result also viewed Pseudomonas spp was not detected in all samples investigated in tow species in all seasons through this study.

الخلاصة

الهدف من هذه الدراسة هو الكشف عن العامل البكتيري المسبب لمرض التسمم الدموي (الإيرموناس والسودوموناس ) ونسبة إنتشار هذه الأنواع في فصول ( الشتاء، الصيف والخريف).

وأجريت الدراسة على 35 سمكة (19 بلطي و 16 قرموطة) وأخذت العينات من سمكت البلطي والقرموط من الخياشيم، الخرباب، الأمعاء، الكبد، المعدة، الكلية. وجمعت العينات من خزان جبل الأوليداء ومخاليب الشجرة (نهر النيل) ومن مزرعة مركز بحوث الأسماك بالشجرة في الفترة ما بين ديسمبر 2012م إلى يونيو 2013م وقد أجريت الدراسة بمعهد البحوث البيطرية، قسم البكتيريا – سوبا ولاية الخرطوم.

وقد أظهرت النتائج وجود فرق معنوي عالي بين فصلي السنة والأعضاء المختلفة وفرق معنوي بين سمكي الدراسة في معدل إنتشار الإيرموناس.
وأيضاً أظهرت الدراسة عدم عزل السدوموناس من سمكتي الدراسة خلال مواسم السنة المختلفة.
