# DEDICATION

I dedicate this dissertation to

My father,

To my mother ,

To my brothers,

Colleagues,

and friends,

# ACKNOWLEDGMENT

I would like to express the deepest gratefulness to my supervisor **Dr. Samia Hamid Ahmed**, for her support understanding during this work.

Also I acknowledge the Fishery Department staff in Sudan University who assisted my training and education during the study courses.

Thanks and gratefulness is extended to my friend, U. Omer Abu-alhassan University of Gezira – College of Animal Production – Dep. Of Fisheries & Wildlife, who helped me in the final arrangement.

Finally my deep thanks extended to my father and my mother Nana Fawzi who encouraged during this lengthy work.

## ABSTRACT

The aim of this study to determine the levels of microorganisms in Kawara fish( *Alestes dentex*) fermented by adding salt for a period of time (15days) and to identify certain contaminant bacteria. This study was conducted in Sudan University of Science and Technology, College of Medical Laboratories. The samples were collected from El-murda Fish Market after that were divided into two groups the first group was transported to Sudan University of Science and Technology, College of Medical Laboratories, Laboratory of microbiology to determine the bacterial load. And the second group was treated by the fermentation process for (15days). Then the samples was tested microbiologically, the results were  $3.6 \times 10^6 \pm 2.3 \times 10^7$  CFU/g in fresh samples and  $2.1 \times 10^6 \pm 1.1 \times 10^6$  CFU/g in fermented samples (Terkin) , from results the data showed significant decrease( $P < 0.04$ ) in the levels of microorganisms in fermented samples. Also from results only *Staphylococcus aureus* were isolated from Terkin samples while *E-coli* and *Salmonella* spp. were not recovered from the Terkin after 15 days of fermentation.

## ملخص الدراسة

الهدف من هذه الدراسة تحديد مستوى البكتريا فى اسماك الكوارة *Alestes dentex* المخمرة بواسطة اضافة الملح اليها وتخميرها لمدة (15 يوم ) مايعرف ( بالتركين) والتعرف على بعض انواع البكتريا الموجوده.

اجريت هذه الدراسة فى جامعة السودان للعلوم والتكنولوجيا كلية المختبرات الطبية تم جمع العينات من سوق المورده حيث تم تقسيمها الى مجموعتين المجموعة الاولى تم ارسالها الى جامعة السودان للعلوم والتكنولوجيا كلية المختبرات الطبية معمل الاحياء الدقيقة لتحديد مستوى البكتريا عليها والمجموعة الثانية بعد تنظيفها تمت معالجتها باضافة نسبة من الملح وتخميرها لمدة 15 يوم وبعد ذلك تم تحديد مستوى البكتريا فى المنتج المخمر(تركين) و النتيجة كانت  $3.6 \times 10^6 \pm$   $2.1 \times 10^6 \pm 1.1 \times 10^6$  CFU/g في العينات الطازجة وبينما العينات المخمرة سجلت  $2.3 \times 10^7$  CFU/g لوحظ من النتيجة ان هناك فرق معنوى فى مستوى البكتريا (  $P < 0.04$ ) بين اسماك الكوارة الطازجة والمخمرة باضافة الملح . اما بالنسبة لانواع البكتريا التى تم عزلها من الاسماك المخمرة من خلال الاختبار لوحظ وجود *Staphylococcus aureus* بينما وجد ان *Salmonella* spp. و *Escherichia coli* لوجود لها فى جميع العينات.
