

## ***Acknowledgements***

***Firstly, I am grateful to my majestic Allah,  
who made this work possible to be done.  
With a great touch of pleasure and gratitude,  
I would like to express thanks to my  
supervisor professorAbdElhamid Ahmed  
Mohamed Elfadil for his advices, directions  
and continuous interest and constructive  
.criticism in reviewing the dissertation***

***My thanks should extend also to Elkadaro  
slaughterhouse staff for assistance during  
the period of samples collection. At last, my  
gratitude goes to any person who advised  
.me, or added any information***

## ***Dedication***

***To those who encouraged me from my birth  
day till now... to those who made the  
impossible, possible... to those who turned  
....my life into a better one***

***MY PARENTS***

***MY SISTER***

***MY BROTHERS***

***Mona Yousif***

## **ABSTRACT**

A cross-sectional study was conducted on 302 cattle slaughtered at Elkadaro slaughterhouse in Khartoum State, Sudan, during the period extended from April to June 2014 to estimate the prevalence of fasciolosis in slaughtered cattle and to investigate the potential risk factors associated with the disease.

Routine meat inspection procedure was employed to detect the presence of *fasciola* in liver. The study showed that the overall prevalence was 5% the prevalence of bovine fasciolosis at post-mortem was found to be 3.3% and .the prevalence by fecal examination was 1.7%

A univariate analysis was performed using the Chi-square as a test of significance for the association between the infection and the investigated potential risk factors. Significant association was detected between bovine fasciolosis infection and each of age (p-value = 0.00), breed (p-value = 0.00) and animal source (p-value . (= 0.00

In multivariate analysis four risk factors were found to be significantly associated (p-value  $\leq$  0.05) with fasciolosis. These risk factors included age (p-value = 0.00), breed (p-value = 0.00), animal source (p-value = 0.00) and grazing .(type (p-value = 0.005

## ملخص البحث

أجريت دراسة إستقصائية على 302 حيوان من الأبقار المذبوحة بمسلخ الكدرو في ولاية الخرطوم، السودان خلال الفترة التي إمتدت من أبريل إلى يونيو 2014. كان الهدف من الدراسة تقدير معدل إنتشار مرض الفاشيولا (ابو كبيدة) فيها والتحقق من عوامل الخطر المرتبطة بهذا المرض. أجرى التفتيش الروتينى للحوم للكشف عن وجود الفاشيولا في الكبد و اظهرت الدراسة ان نسبة الاصابة الكلية 5%. (نسبة انتشار مرض الفاشيولا 3.3% من خلال فحص الكبد في السلخانة و 1.7% من خلال فحص البراز في المعمل) .

تم تحليل البيانات بالتحليل احادي العوامل باستخدام مربع كاي لتحليل قيمة عوامل الخطر، وجد أن :العمر(قيمه=0.00) ، سلالة الحيوان(قيمة=0.00) ومصدر الحيوان(قيمه=0.00). توجد علاقة معنوية بين عوامل الخطر والاصابة بالمرض.

تم تحليل البيانات بالتحليل متعدد العوامل وجد أن هناك علاقة معنوية بين عوامل الخطر والاصابة بالمرض كانت قيمته كالاتي:العمر(قيمه=0.00) ، سلالة

الحيوان(قيمة=0.00) نوع الرعي(قيمتة=0.00) ومصدر الحيوان(قيمتة=0.00). توجد

علاقة معنوية بين عوامل الخطر والاصابة بالمرض.
