

الآية

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

قال تعالى:

سَنُرِيهِمْ آيَاتِنَا فِي الْأَفَاقِ وَفِي أَنْفُسِهِمْ
حَتَّىٰ يَتَبَيَّنَ لَهُمْ أَنَّهُ الْحَقُّ أَوَلَمْ يَكْفِ
بِرَبِّكَ أَنَّهُ عَلَىٰ كُلِّ شَيْءٍ شَهِيدٌ

صدق الله العظيم

سورة فصلت الآية 53

Dedication

To my parents

To my brothers

To my friends

And To my family

Acknowledgments

Firstly grateful thanks to ALMIGHTY ALLAH, for helping me in completing this research. I would like to acknowledge Dr. Yousif Fadlalla Hamedelnil, for his unfailing patience, expert advices, supervision, guidance and valuable time. Thanks extended to College of Medical Laboratory Science staff. My thanks and appreciations are extended to my colleges and friends who strongly supported me throughout this study.

A lot of thanks to the staff of Alboluk Pediatrics Hospital.

Abstract

The main aim of this study was to determine the presence of acute hepatitis E virus infection among children in Khartoum State using Enzyme-Linked Immunosorbent Assay (ELISA). The study was carried out during the period from October 2013 to January 2014. Ninety one children with signs and symptoms of jaundice attended to Alboluk Pediatrics Hospital were enrolled in this study. Three (3.3%) were positive for anti-HEV IgM while 88 (96.7%) were negative for anti-HEV IgM. 52 (57.1%) were males while 39 (42.9%) were females. Out of 3 IgM positive of children it was found that 2 males (2.2%) and one female (1.1%) were anti-HEV IgM positive. 41(45.1%) were localized in rural area while 50 (54.9%) were localized in urban area. It was found that 2 from rural area (2.2%) and one from urban area (1.1%) were anti-HEV IgM positive. According to age group 33 (36.3%) were between 2-5 years, 36 (39.6%) were between 6-10 years while 22 (24.2%) were between 11 to 14 years. It was found that all positive anti-HEV IgM were in the group aged between 11-14. The gender of the children had no significant effect ($p > 0.05$) on prevalence of anti-HEV IgM among children examined. The geographic area of the children had no significant effect on prevalence of anti-HEV IgM ($p > 0.05$). The age group had a significant effect on prevalence of anti-HEV IgM ($p < 0.05$). This study concluded that acute HEV has

low frequency among children. This study recommend to enhance the testing for Hepatitis E virus in all acute hepatitis cases, especially for those negative for Hepatitis B and C. HEV vaccine is recommended for risk groups.

النتائج

E الهدف الرئيسي من هذه الدراسة هو الكشف المصلى الأجسام المضادة لفيروس الكبد الوبائي عند الأطفال باستخدام جهاز يعتمد على نظرية التقارب اللوني لتحديد الأجسام المضادة من تم جمع 91 عينة دم من أطفال يعانون من علامات واعراض اليرقان (IgM). النمط حضروا إلى مستشفى البك التخصصي للأطفال. من بين 91 طفل وجد ان 3 (3.3%) يعانون و 88 (96.7%). يعانون من الإصابة. (IgM). من الإصابة بفيروس الكبد الوبائي إي الحاد من بين 91 طفل, 52 منهم كانوا ذكورا (57.1%) و 39 كانوا اناثا (42.9%). من بين 3 أطفال ايجابى الأجسام المضادة 2 منهم كانوا ذكورا (2.2%) وواحدة منهم كانت انثى (1.1%) كما انه لا توجد فروقات ذات دلالة احصائية حسب النوع (القيمة الاحتمالية أكبر من 0.05). وجد أن الـ 3 اطفال ايجابى الأجسام المضادة اثنان منهم كانوا من الريف وواحد كان من و مكان العيش (القيمة (IgM) الحضر, لا توجد دلالة احصائية بين وجود الاجسام المضادة الاحتمالية أكبر من 0.05). كما أنه لا توجد فروقات ذات دلالة احصائية بين ووجود القيمة الاحتمالية أكبر من 0.05). كذلك وجد أنه لا توجد (IgM) الأجسام المضادة من النمط فروقات ذات دلالة احصائية بين (القيمة الاحتمالية أكبر من 0.05). من هذه الدراسة وجد أن هناك نسبة منخفضة للإصابة بفيروس الكبد الوبائي إي فى الأطفال. اوصت الدراسة باهمية الكشف عن فيروس الكبد الوبائي إي في الاشخاص الذين لم تظهر اصابتهم بفيروس E. كذلك اوصت بضرورة التحصين ضد فيروس الكبد الوبائي B. و A الكبد الوبائي
