

CHAPTER 5

Energy balance

5.1. Introduction:

As with mass, energy can be considered to be separately conserved in all but nuclear process. The conservation of energy, however, differ from that of mass in that energy can be generated (or consumed) in a chemical process. The Total enthalpy of the outlet streams will not be equal that of the inlet streams if energy is generated or consumed in the processes; such as that due to heat of reaction.

In process design, energy balance is made to determine the energy requirements of the process: the heating, cooling and power required. In plant operation, an energy balance on the plant operation will show the pattern of energy usage and suggest areas for conservation and savings.

5.2. Conservation of energy:

The general equation can be written for conservation of energy is:

$$\text{Energy out} = \text{Energy in} - \text{Generation} - \text{Consumption} - \text{Accumulation.}$$

This is a statement of the first law of thermodynamics.

Chemical reaction will evolve energy (exothermic) or consume energy (endothermic). For steady-state process the accumulation of both mass and energy will be zero.

5.3. Energy balance calculations:

-symbols used in this chapter:

C_{Pi} = Heat capacity of component (i).

T = Temperature of stream in degree Kelvin.

M_{ij} = Mole flow of component (i) in stream (j).

H_j = Total enthalpy of stream (j).

H_{ij} = enthalpy of component (i) in stream (j).

5.3.1. Energy balance around summing point:

$$Q - W = \Delta H$$

W = 0, Q = 0(adiabatic mixing).

$$\Delta H = H_{\text{out}}$$

$$H_1 + H_{15} = H_3$$

$$H_2 + H_3 = H_4$$

$H_1 = H_2 = 0$; so:

$$H_{15} = H_3 = H_4$$

$$H_{15} = H_{\text{MTBE15}} + H_{\text{M15}} + H_{\text{ISO15}} + H_{1-\text{BUT15}} + H_{2-\text{BUT15}} - H_{\text{W15}}$$

$$P_T = 4.95 \text{ bar.}$$

$T = 314.3^\circ\text{K}$ (bubble point), this temperature gives:

$$\sum Y_i = \sum P_i(T)X_i/P_T = 1$$

$$P_i = \text{EXP}(A+B/T+C \ln T + DT^E).$$

Where:

P_i : is vapor pressure of component(i).

$$H_{M13} = M_{M13} \int_{298}^{363} cp \, dt.$$

M_{M13} from material balance caculation = 2428.73Kmol/h.

$$H_{M13} = 2428.73 * [106(363-298) - 0.362/2(363^2-298^2) + 0.938E-3/3(363^3-298^3)].$$

5.3.6. Energy balance around distillation column (T903):

$$Q_r - Q_c = H_{15} + H_{16} - H_{14}$$

$H_{14} = H_{13} = 1972318662 \text{KJ}/\text{h}$ (o change in enthalpy through the pump).

$$H_{15} = 2781433.8 \text{ KJ/h.}$$

- Condenser duty calculation:

Vapor temp. = 322.1 °K (dew point).

$$Q_c = (1 + R)(H_{V15} - H_{15}).$$

$$R = 3.84.$$

H_{V15} Can be calculated by using

heat capacity constants for ideal gases,
with the following equation:

$$H_{iV15} = M_{i15} \left[\int_{298}^{322.1} cp dt + \lambda_{298} \right].$$

$$\rightarrow H_{V15} = 3744574.894 \text{ KJ/h.}$$

$$\therefore Q_c = 4.84(3744574.894 - 2781433.8)$$

$$Q_c = 4661602.895 \text{ KJ/h.}$$

- Amount of cooling water:

$$M = \frac{Q_c}{cp_{water}\Delta T} = \frac{4661602.895}{4.18(40-30)} = 111521.6 \text{ Kg/h.}$$

$$H_{16} = H_{MTBE16} + H_{M16} + H_{ISO16} + H_{1-BUT16} + H_{2-BUT16} - H_{W16}$$

from material balance calculation:

$$M_{mtbe16} = M_{ISO16} = M_{1-BUT16} = M_{2-BUT16} = 0.00 \text{ Kmol/h; so:}$$

$$H_{mtbe16} = H_{ISO16} = H_{1-BUT16} = H_{2-BUT16} = 0.00 \text{ KJ/h.}$$

$$H_{16} = H_{w16} + H_{M16}$$

$$H_{M16} = M_{M16} \int_{298}^{430.2} cp dt.$$

$$M_{M16} \text{ from material balance calculation} = 375.58 \text{ Kmol/h.}$$

$$H_{M16} = 375.58 * [106(430.2-298) - 0.362/2(v^2-298^2) + 0.938E-3/3(430.2^3-298^3)].$$

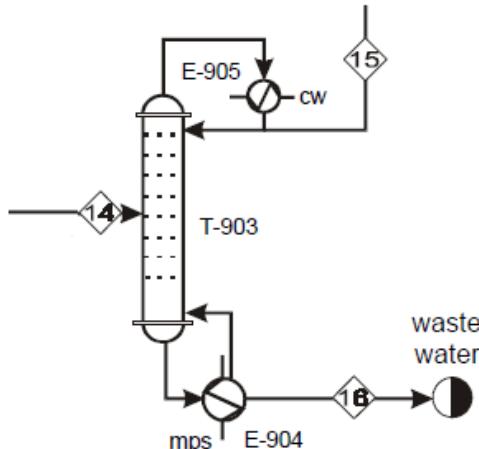

$$H_{M16} = 16824464.12 \text{ KJ/h.}$$

$$H_{w16} = M_{w16} \int_{298}^{430.2} cp dt$$

$$M_{w16} \text{ from material balance calculation} = 12143.66 \text{ Kmol/h.}$$

$$H_{w16} = 12143.66 * [276 (430.2-298) - 2.09/2(430.2^2-298^2) + 0.00825/3(430.2^3-298^3) + 1.41E-05/4(430.2^4-298^4) + 9.37E-09/5(430.2^5-298^5)].$$

$$H_{w16} = 5849089008 \text{ KJ/h.}$$

$$H_{16} = 16824464.12 + 5849089008$$

$$H_{16} = 5865913472 \text{ KJ/h.}$$

- Reboiler duty calculation:

$$Q_r - Q_c = H_{15} + H_{16} - H_{14}$$

$$Q_r = 48907569980 \text{ KJ/h.}$$

-Amount of stream needed:

$$M = \frac{Q_r}{\lambda_{\text{stream}}} = \frac{48907569980}{36098.259} = \frac{1354845.6 \text{ Kmol}}{\text{h}} = 24387222.1 \text{ Kg/h.}$$
