

Dedication

To my father

To my mother

To My brothers

To My sisters

To my wife

To my sons

To my daughters

To My colleagues and friends

To my supervisors

To all those

I dedicate this humble work.

Declaration

The study presented in this thesis was completed by the author whilst he was a postgraduate student at the College of Graduate Studies and Scientific Research, Sudan University of Science and Technology.

I hereby affirm that the content of this thesis is original research conducted by the author. All views and conclusion are the sole responsibility of the author. All references to previous work are included at the end of the thesis.

I certify that the content of this thesis has not already been submitted for any degree and is not being currently submitted for any other degree.

AMIR MOHAMMED OSMAN

Ph.D. Candidate

ACKNOWLEDGMENT

My end less thanks first and last to my God for completing this study. And I would like to express my sincerest thanks and appreciation to my main supervisor Prof. Mohammed Tag eldeen for his supervision and valuable guidance during the research period. His sincere technical advice and moral support allowed me to complete this work. My deep appreciation and much gratitude is due to my Co-Supervisor Dr. Sumaia abu kashawa for unfailing help rendered during this work, and their valuable advice and encouragement.

Sincere thanks and gratitude go to Dr.Shamas eldin and prof: Intsar Turki for their vital and fruitful help in my research and thanks also are due to the staff of Faculty of veterinary specially Mr. Gammer fadelmoula, for laboratory analysis.

Especial thank for my friends Mr.Abubaker said , Dr.Amir elobaid and Anwer Alamin for their help during data collection from field area.

Many thanks to my friends for data collection and their helping are Dr.Ali Hassan , Dr.Talat, Abdo Bushara, Abdel teef Mr,shogei hamza ,Dr.Mohamed Ibrhim ,Ms.Mona Hassan, Mr.Hussein Hag Mussa and Dr.Mohammed Abdelkreim.

Thanks also extends to my brothers especial thank for role on my research kamal, Motaz and my friend Osama Yusif.

Finally I would like to express my thanks to all who help and co-operated with me till this work has been accomplished.

Abstract

The study was conducted in different locations in Butana area (Gadarif, Showak, Sharif Hassab Allah , um-gargoor, Alsobagh). The study aim to determine the effect of breed types, sex and age group on somebody measurements of some Sudanese breed type's camel, also to assess some field management practices adopted by herder men and camel owners.

Milk samples from 60 she-camels (*Camelus dromedaries*) in different parity numbers (one to fifth) and in different breed types (Anafi n=10, Kenana n=20, Daili n=12 and Arabi n=18) were randomly collected in June 2013 to investigate the effect of parity and breed types on some physicochemical components of camels milk. The effect of parity and breed types on milk yield and components were investigated by ANOVA test followed by multiple comparisons using (LSD) test and the relation of difference components of camel milk were calculated using Pearson correlation. The data of present study was analyzed by using SPSS. Milk yield, fat, SNF and protein were affected by parity number ($P<0.05$). Significant differences ($P<0.05$) of breed types were recorded in freezing point, conductivity, milk yield, fat, lactose, ash, SNF and protein. The results showed strong positive correlation ($P<0.01$) in density, freezing point, Fat, SNF, lactose, ash and protein. But between fat and lactose, fat and ash were positively correlated ($P<0.05$). The correlation of each parameter with the added water and conductivity was negatively highly significant ($P<0.01$).

Also the study was used two hundred and eighty head were to five breed types of Sudanese camel (Bishari, Arabi, Daili, Anafi and Kenani) were randomly selected from Gadarif state. The purpose of this part of the study was to determine the effect of breed types, sex and age group on some body measurements of the five Sudanese breed types camel. Body measurements were taken using metric tape (height at wither, heart girth, barrel girth, neck length, face length, tail length,

and body weight). Complete Randomized Design was used to analyze the results obtained from this part of study and subjected to General Linear model (GLM) followed by Least significant difference test (LSD) using the SPSS 20.0 computer program, as 5 X 2 X 4 factorial design averages of height at wither, heart girth, barrel girth, neck length, face length, tail length and body weight were 1.85 ± 0.02 m, 2.02 ± 0.02 m, 2.52 ± 0.02 m, 1.13 ± 0.01 m, 58.84 ± 0.28 cm, 68.60 ± 0.42 cm and 512.30 ± 7.84 kg respectively. The results also revealed that body measurements were significantly affected by type of camel and age group. The Kenani camel showed the highest values in all studied body measurements followed by other breed types. Regarding to the age groups the camels in the fourth age group (8 to 9 years) had significantly high values in all body measurements followed by those of the third group 10 to 12 years, while the animals in the first group ≤ 4 years recorded the lowest values. Furthermore, the results showed that the sex of camel significantly affected the heart girth, face length and body weight; and the males had significantly higher ($P < 0.05$) values than those of females.

Also a set of detailed structured questionnaires were used to collect information from a total of sixty camel owners in different locations in Butana area in interview conducted over single visit. The questionnaire was designed to obtain information on general household information, relation with camel and life mode of camel owners, purposes of keeping and rearing camels, breeding practices, milk production and milking practices, feeding and watering and constrains of camel production and veterinary services. This part of study was revealed that most of camel owners was illiterate, practiced both rearing camels and agriculture and had experience more than 20 years in camel rearing as professions also they bred camel as life manner the results showed that camel owners select their animals according to breeding history, followed by productivity and morphological features moreover they focused on milk and meat improvement purposes and the majority of them kept the male from the same herd and prefer to

bred Arabi, Daili, and Anafi breed type. More than half percent of camel owners select their male at 6 years age and keep it until 15 years. The results showed that most of she-camel produced from 2 to 3 kg milk/day in lactation period of 10 months, the majority of camel owners used calve in milk let down and they milked she-camels twice a day, also the majority consumed the produced milk, while view of them 3 sold the produced milk and took the milk for calve. The study showed that the main source of camels feed was the pastures and the camels preferred to eat trees, bushes and grasses. Also the result showed that the main source of water is river, wells 3and natural water net . The results showed that the majority of camel owners watering their camels in summer every three, while in winter more than half percent of camel owners watering their camels every six days. The main constrain of camel production was diseases, followed by the lack of feed, water.

مستخلص البحث

أجريت الدراسة في مناطق مختلفة في منطقة البطانة (القضارف، الشواك، شريف حسب الله، أم قرقور والصباع). هدفت الدراسة الى تحديد تأثير النوع والسلالة والعمر على بعض قياسات الجسم ومكونات الحليب لبعض سلالات الإبل السودانية، اضافة الى تقييم بعض الممارسات الحقلية لملاك الإبل. تم اخذ عدد من عينات الحليب من 60 من النوق (نوالسنام الواحد) بعدد ولادات مختلفة (5-1) وعدد سلالات مختلفة (عنافي ن =10 ، كناني ن=20 ، دعيلى ن =12 وعربي ن= 18) تم جمعها عشوائياً في شهر يوليو 2013 لمعرفة تأثير الولادات ونوع السلالة على بعض المكونات الفيزيوكيميائية للبن الإبل. تم التأكد من تأثير عدد الولادات ونوع السلالة على إنتاج الحليب ومكوناته بواسطة إختبار نوكا يليها استخدام جداول المقارنات العديد باستخدام إختبار الفروقات المعنوية، وإختلاف العلاقة في مكونات اللبن تم حسابها باستخدام إرتباط بيرسون، تم تحليل بيانات الدراسة إحصائياً : إنتاج الحليب،الدهون،الموادالصلبة الغيردهنية والبروتين، تتأثر بواسطة عددالولادات ($p < 0.05$) الإختلاف الكبير في نوع السلالة تم تسجيلها في درجة التجمد،التوصيلية،إنتاج اللبن،الدهون،اللاكتوز،الرماد،المواد الصلبة الغيردهنية والبروتين . أوضحت النتائج إرتباط إيجابي قوي ($p < 0.01$) في الكثافة، التجمد، الدهون، الموادالصلبة الغيردهنية ،اللاكتوز، الرمد والبروتين . ولكن بمقارنة الدهون مع اللاكتوز والدهون مع الرمد أظهرت إرتباط إيجابي ($p < 0.05$). كان الإرتباط في كل معامل ات عند إضافة الماء والتوصيلية أكثرسلبية ($p < 0.01$). أيضاً الدراسة استخدمت 280 رأس تنتمي إلي خمسة أنواع من سلالات مختلفة من الإبل السودانية(كناني ،عنافي، دعيلى،عربي وبشاري) تم إختيارها عشوائياً من

ولاية القضارف. هدف هذا الجزء من الدراسة هو تحديد تأثير عدد الولادات، الجنس والعمر الفئوي على بعض القياسات لخمسة أنواع من سلالات الإبل السودانية، قياسات الجسم أخذت بواسطة الشريط المترى (الطول عند الكتف، محيط الصدر، محيط البطن، طول الرقبة، طول الوجه، طول الذيل ووزن الجسم). استخدم التصميم العشوائي المتكامل لتحليل النتائج المتحصل عليها في هذا متبوعاً الجزء من الدراسة وأخضعت للنموذج الخطي العاملي بإختبار الفروق المعنوية باستخدام التحليل الإحصائي 20.0 برنامج حاسوب مثلاً (5*4*2) مضروب تصميم المتوسطات الطول عند الكتف، محيط الصدر، محيط البطن، طول الرقبة، وطول الوجه، طول الذيل ووزن الجسم تساوي (0.02±1.85 متر، 02.±0.02 متر، 0.02±2.52 متر، 1.13±0.01 متر، 0.28±58.84 سنتمتر، 68.60±0.42 سنتمتر و 512.30±7.84 كجم) على التوالي. كما كشفت النتائج أيضاً أن قياسات الجسم تأثرت كثير بنوع الإبل والفئة العمرية للإبل. الكنانى أظهر القيمة الأعلى في كل الدراسة متبوعاً بأنواع السلالات الأخرى.

فيما يتعلق بالفئات العمرية فإن الإبل في الفئة العمرية الرابعة (8-9) سنوات أظهرت قيم عالية بشكل ملحوظ في جميع قياسات الجسم يليها الفئة العمرية الثالثة (10-12) سنة، حيث أن الحيوانات في المجموعة الأولى (العمر ≥4 سنوات) سجلت أقل القياسات أو القيم . الى حد ما أظهرت النتائج أن الجنس يؤثر بشكل كبير على محيط الصدر، طول الوجه ووزن الجسم وكان للذكور قيم قياسات أعلى بكثير من الإناث ($p < 0.05$) . كما استخدمت مجموعة إستبيانات منظمة ومفصلة لجمع المعلومات لعدد 60 من أصحاب الإبل من مواقع مختلفة من منطقة البطانة في مقابلة أجريت خلال زيارة لكل مالك للإبل . الاستبيان صمم للحصول على معلومات عامة عن الأسر وعلاقتها مع الإبل، نمط حياة أصحاب الإبل، الغرض من حفظ وتربية الأبل والعمليات الوراثية، إنتاج الحليب وممارسات الحليب، التغذية والسقاية ومعوقات إنتاج الإبل والخدمات البيطرية. أظهر هذا الجزء

من الدراسة أن أغلب أصحاب الإبل أميون يمارسون تربية الإبل والزراعة معا ويملكون خبرة أكثر من عشرين عام في تربية الإبل كحرفة وأيضاً تربي الإبل كمظهر اجتماعي . أظهرت الدراسة أيضاً أن أصحاب الإبل يختارون حيواناتهم وفقاً لتاريخ التربية متبوعاً بالإنتاجية ووالشكل الخارجي علاوة على ذلك فإنهم يركزون على أهداف تحسين الحليب واللحوم، الغالبية منهم أبقّت الذكور من نفس القطيع ويفضلون أنواع العربي الرشايدي والعنابي. أكثر من 50% من أصحاب الإبل يختارون الذكور في عمر 6 سنوات ويحتفظون بها حتى 15 سنة. أظهرت النتائج أن أغلب النياق تنتج حوالي 2-3 كجم من الحليب في اليوم خلال فترة الإدرار لمدة عشرة شهور . أغلب أصحاب الأبل يستخدمون المواليد لإدرار اللبن . و وأن الإبل تُحلب مرتين في اليوم، وأيضاً لأغلبية تسهلك اللبن المنتج وأنهم يستخدمونه الا القليل منهم يبيعونه.

أظهرت الدراسة أن المصدر الأساسي لتغذية الإبل هو المراعي (حيث تفضل الأبل الأشجار والأعشاب). وأن المصدر الأساسي للماء هو النهر، الآبار والحفائر، كما إتضح أن أصحاب الإبل يسقونها كل ثلاثة أيام في الصيف وكل سنة أيام في الشتاء، والمعوق الأساسي لإنتاج الإبل هو الأمراض يليها نقص الأعلاف والمياه.

وقد اوصت الدراسة بمزيد من الاهتمام بالإبل ومزيداً من الدراسات في هذا المجال .
