
Dedication

ı:

my mother ^ My father

My brothers ^ my sister **S**

My friend **S**

ACKNOWLEDGEMENT:

Firstly I thank Allah for giving me the strength to complete this work, also my thanks and gratitude to professor :Mohamed Abdel Salam Abdulla , He took part in the supervision and guidance to me until the work was completed. for providing necessary facilities for the research work .and support in revising the text and giving valuable advices through different stage of this study. Do not forget to thank Elsadig Mohamed Ali Hasab Elrasol. And thanks extend to Dr. Osman Hamid *Animal Resources Research Corporation, department of parasitology, Soba* , he was instrumental in helping me in the proper research and guideline. Special thanks to my friend Ds .Shaker Backlit Bukhara, he cooperation during the study. And help me in collected sample.

Abstract:

A cross-sectional epidemiological study was conducted from November 2015 to January 2015 to estimate the prevalence and investigate risk factors associated with the Fasciolosis due to the disease in cattle slaughtered at two abattoirs Ganaua and El Sahafa were selected from the localities of Khartoum State. Among the total of 375 cattle examined at post mortem and fecal examination by sedimentation ,32 animals were positive and prevalence of Fasciolosis was 8.5%.

Univariate analysis showed that there was statistically significant association between infection and age of animal ($X^2= 9.278$) (p- value 0.002). Association body condition of animal and disease ($X^2=17.436$) (p - value = 0.000). Also The Chi-square test showed significant association between *Fasciola* infection and grazing system ($X=0.337$ p-value=0.562), vegetation statistically significant association with disease($X= 3.098$ p-value=0.078), using drug shows that there was statistically significant association with disease ($X^2 9.730$) (p-value = 0.002). present of snail statistically significant association with disease($X^2=3.724$) (p-value = 0.002), Manure disposal statistically significant association with disease($X^2=3.044$,p-value=0.081). However sex ,breed, source of animal , ,water body, and knowledge were not found significant association (p- value ≤ 0.05). . Multivariate analysis showed strength of association between risk factors (age , Body condition and vegetation and disease ,showed statistically significant association (p-value ≤ 0.05).

ملخص البحث

أجريت دراسة مقطعية وبائية في الفترة ما بين من نوفمبر 2015 حتى يناير 2015

لتقدير معدل انتشار وعوامل الخطر المرتبطة بمرض الفاشيولا في الأبقار المذبوحة في سلخاني قناوة والصحافة تم اختيارها من محليات ولاية الخرطوم . من بين ما مجموعه 375 من الأبقار تم فحصها بعد الذبح في السلخانة وبواسطة تحليل البراز بطريقة الترسيب ، فوجد ان 32 رأس من الأبقار مصابة بمرض

. الفاشيولا

. وأظهر الدراسة أن نسبة انتشار الفاشيولا 8.5% من خلال الفحص الروتيني للحوم وفحص البراز له علاقة معنوية تحت قيم معنوية اقل من او تساوى (25.0) هناك ارتباط ذات دلالة إحصائية بين العدوى وعمر الحيوان (مربع كاي = 9.278) (قيمة ف = 0.002) ، وارتباط بين الصحة الجسمية للحيوان والمرض (مربع كاي = 17.436) (- قيمة ف = 0.000) ، كما أظهر اختبار مربع كاي علاقة ذات دلالة إحصائية بين المرض ونظام الري (مربع كاي = 0.337) (وقيمه ف = 0.562) وارتباط بين المرض ووجود الأعشاب (مربع كاي = 3.098) (قيمة ف = 0.078) واستخدام الادوية (مربع كاي = 9.730) (وقيمة ف = 0.002) ، ارتباط ذات دلالة إحصائية بين وجود القواقع و المرض (مربع كاي = 3.724) (وقيمة ف = 0.0054) ، ارتباط ذات دلالة إحصائية بين المرض والتخلص من الفضلات العضوية (مربع كاي = 3.044) ومع ذلك الجنس، والسلالة، مصدر الحيوانات ، مصادر المياه، ومعرفة المرض ليس لهم علاقة معنوية مع حدوث الفاشيولا تحت قيم معنوية اكبر من (250). وأظهر التحليل متعدد المتغيرات قوة الارتباط بين عوامل الخطر (العمر، حالة الجسم والغطاء النباتي والمرض، تحت قيم معنوية اقل من او تساوى (قيمة $P < 0.05$).
