**A THESIS SUBMITTED IN FULFILMENTS FOR THE DEGREE OF M.Sc.  
IN PETROLEUM EXPLORATION ENGINEERING**

**M.Sc. Candidate: Hafiza Babiker Mohammed Ahmed**

**Supervisor : Dr. Abbas Musa Yagoub**

**July, 2015**

## **Dedication**

I dedicate this work to my mother, family and friends back home for their support and all the encouragements, without which it would have been difficult for me to pull through. Thank you for your prayers and everything.

## **Acknowledgments**

First and foremost I want to thank Dr **Abbas Musa** who's supervised this study, I also extend my gratitude to **Abdullah Abdelgabar** and **Motaz Eltahir** for all the expert counsel and guidance they gave me to see the fruition of this study. Thank you for encouraging me to go on through the challenging moments of my research.

Special thanks to ministry of energy mining – Oil Exploration & Production Authority (OEPA) for their outstanding co-operation in sourcing and sharing their data with me.

Above all I give thanks to the Almighty God for His grace that saw me through it all during my study. I am forever indebted to Him.

## **Abstract**

Muglad Basin of Sudan is highly complicated by faulting. Interpreted seismic data show large numbers of tensional faults which have affected the overall basin and have formed several sub-basins. One of the sub-basins distributed around Muglad Basin is Rakuba sub-basin.

This study aims to conduct formation evaluation on Rakuba sub-basin, and focuses on Bentiu and Abu Gabra formations through well logging data interpretation gathered from three wells Najah1, Falah1, and Rabah1. The main goal is divided into two stages; the first stage is to do petro-physical evaluation, and the other stage is log-facies analysis.

Petrophysical evaluation has been performed where shale volume has been calculated; furthermore porosity, water saturation, permeability, and cut off have been estimated. Moreover, results properties correlated, to facilitate second stage log-facies made based on K-mean cluster analysis.

According to methods applied to data and after analyzing, Bentiu formation classified as a good homogenous reservoir rock, Abu Gabra formation classified as heterogeneous formation and possible to be a source rock. However both of them are full saturated with water. The rock type identified and categorized into three facies.

## **ملخص الدراسة**

يعتبر حوض المجلد الرسوبي معقد جداً بسبب الفووالق. تفسير البياناتزلالية اوضح ان هنالك عدد كبير من فووالق الشد اثرت على كل هذا الحوض الرسوبي و نتج عن ذلك عدد من الاحواض الرسوبيه الفرعية منها حوض راكوبة الفرعية الرسوبي. احد هذه الاحواض الرسوبيه الفرعية المتوزعه داخل حوض المجلد الرسوبي.

تهدف هذه الدراسة علي عمل تقييم للتكوينات الصخرية بحوض راكوبة الرسوبي الفرعي، حيث تستهدف الدراسة متكوني بانتيو وابوجابر من خلال تفسير بيانات تسجيلات الابار المتحصل عليها من ثلاثة ابار نجاح-1، فلاح-1 ورباح-1 ينقسم الهدف الاساسي الي مرحلتين: المرحلة الاولى عباره عن عمل تقييم للخواص الفزيائية للصخور، والمرحلة الثانية عباره عن تحليل السحنات الصخرية.

تم تقييم الخواص الفزيائية للصخور حيث تم حساب كمية الطفل، وايضاً تم حساب كلاً من المسامية والتسبيع بالماء والنفاذية. أيضاً المضاهاة بين النتائج. بواسطة التحليل العقدي وعن طريق استخدام طريقة K-mean تم تحديد السحنات الصخرية.

بعد تطبيق الطرق وتحليل النتائج، خلصنا الا ان تكون بانتيو عباره عن صخور مكممية متجانسة، متكون ابوجابرة عباره عن صخور متجانسة ولها احتمالية علي ان تكون صخور مصدر. كما وجد ان المتكونين متسبعين تماماً بالماء. كما تم تمييز الصخور وتصنيفها الى ثلاث سحنات اساسية
