# **DEDICATION**

This thesis is dedicated to my parents, family and my close friends

And specially dedication to my spiritual as well as the lumiition of my

home my sincere wife "Hanan Taifour"

And to my kids

# ACKNOLOWEDGMENT

First of all, I would like to say Alhamdulillah for Almight God, for giving me the strength and health to fulfill this project completely.

I express my gratidue to **Assoc. Prof. Dr. Mohammed A. Al**i my chief supervisor for this study and for his steadfast support was greatly needed and deeply appreciated.

I would like to express my utmost gratitude to **Dr. Mohammed Elfadil** for twhat he has tought me durig B. Sc. course (1991-1995)

And warm thanks to my colleagues who have been supporting me to

#### **Abstract**

The aim of the following study was to study the congestive heart failure (CHF) disease by using chest x-ray and ECG in Sudanese Patients, the study taking a sample of 120 patients from Khartoum, Omdurman, Aljazeera, and Kosti hospitals. And the variables were: the age, gender, and clinical history, etiology, habits, BMI, heart/chest ratio, enlarged chamber and the relative deviated wave in ECG. The data analysis showed that: CHF is predominant among male with a percent of 56% relative to 44% among female. CHF have been increased following the age increment and the high incidence of heart disease has occurred among age group of 65-77 years. The majority of the sample was either obese representing 57% or over weight representing 35%. The most common cofactors for induction of CHF were the social stress, diabetes, hypertension and overweight which representing 28%, 22%, 16% and 14% respectively, with less impact of obesity and smoking which representing 13% and 7% respectively. Khartoum state was the most endemic with CHF showing a percent of 40% of the total sample, Aljazeera state showed 25%, White Nile showed 20%, Red Sea showed 10% and West of Sudan showed 5%. The common type of heart diseases was the coronary arteries diseases representing 45% of the total sample, Valves diseases represent 17%, Myocardial infarctions represent 23% and congestive heart failure was 15%. The common signs of patient's Heart Diseases in Sudan during June 2014 – June 2015, which were Hypertension, Diabetes mellitus, High Cholesterol, breathing rate, edema, palpitation with relative frequencies 9%, 11%, 6%, 12%, 8% and 10% respectively. The cardiothoracic ration increases and hence increase the breathing rate/min. and the correlation could be fitted in the following equation: y = 0.020x + 0.202, where y refers to cardiothoracic ratio and x refers to breathing rate/min. and all the patients have CTR exceeding the normal range (0.5) which in turn has direct impact on the breathing rate increment beyond the normal rang 12-20bpm. There is increasing proportional relationship between the age and respiratory rate/min; such relation fits the following equation: y = 0.205x + 12.84, where y refers to respiratory rate/min and x refers to age in years which is significant as R<sup>2</sup> = 0.7. The cardiothoracic ration increases and hence increase the peak of the R wave. And the correlation could be fitted in the following equation: y=29.724x+9.9295.where y refers to peak of R wave and x refer to the cardiothoracic ratio. The common deviated ECG waves were QRS and T with frequencies of 39.1% and 25.5% respectively, with consideration that: the QRS wave represents the state of left ventricle (depolarization of ventricles) while T wave state the re-polarization of the ventricles. The enlarged chamber in the heart was the left ventricle that representing 55% relative to other chambers as 19%, 15%, and 11% for the left atrium, right ventricle and right atrium respectively. The most of the sample were overweight as 45%, obese as 40%, and the normal as 15%. The most common stage of CHF was stage III that showing 55% among the sample relative to stage I (2%), II (30%) and IV (13%).

#### ملخص الرسالة

عنوان البحث: دراسة مرض احتقان القلب باستخدام صور اشعة للصدرونبضات القلب الكهربائية لدي المرضي السودانيين استخلصت الدراسة من عدد 120 مريضا بامراض القلب من مستشفيات مختلفة لولايات الخرطوم الجزيرة،البحر الاحمر،وغرب السودان.

اوضحت الدراسة سيادة مرض احتقان القلب عند الرجال بنسبة 56% وعند النساء بنسبة 44% ، وان الفئة العمرية الاكثر اصابة بالمرض تتراوح اعمار هم مابين 56-77 سنة، وان غالبية المصابين بالمرض يعانون من السمنة بنسبة 55% او لديهم زيادة بالوزن بنسبة 35%.

اظهرت الدراسة ان العومل المساعدة السائدة في العينة لمرضي فشل القلب الاحتقاني هي الضغوط الاجتماعية ،ارتفاع السكر في الدم ، ارتفاع ضغط الدم و زيادة الوزن وهي بنسب علي النحو التالي 28 %،22%و14% مع انخفاض بنسب التدخين والسمنة 13% و 7% علي التوالي.

اوضحت الدراسة ان ولاية الخرطوم هي الاكثر اصابة بالمرض ودلك بنسبة 40%تليها ولاية الجزيرة 25% ، النيل الابيض 20%، البحر الاحمر 10% وولاية غرب السودان 5%، وان مرض القلب الاكثر شيوعا هو مرض الشرايين التاجية بنسبة 45% ، امراض الصمامات 17%، مرض عضلات القلب الاحتشائي 23% ومرض فشل القلب الاحتقاني 15%.

اظهرت الدراسة ان العلامات المرضية السائدة في السودان في الفترة مّا بين 2014/6 الي اظهرت الدراسة ان العلامات المرضية السائدة في السودان في ارتفاع ضغط الدم،ارتفاع سكر الدم, ارتفاع الكلسترول بالدم ،زيادة معدل التنفس، الادمة الدموية وارتفاع نبضات القلب ودلك بنسب 9%, 11% ، 10% ، 11% .

وجدنا بالدراسة زيادة النسبة بين حجم القلب وحجم الصدر مع زيادة معدل التنفس بالدقيقة وهدا التطابق تمثله المعادلة التالية :  $\omega=020$ ,  $\omega+202$  حيث ان  $\omega$  تمثل النسبة بين حجم القلب والصدر وص تمثل معدل التنفس بالدقيقة. كدلك وجدنا ان كل المرضي يعانون من زيادة نسبة حجم القلب لحجم الصدر باكثر من 0.0 ولدلك تأثير علي زيادة معدل التنفس في الدقيقة اكثر من المعدل الطبيعي والدي يتراوح بين 0.0 التنفس في الدقيقة. كما وجدنا ان هنالك علاقة طردية بين زيادة العمر والزيادة في معدل التنفس في الدقيقة ممثلا في المعادلة التالية: 0.0 التنفس في الدقيقة وس تمثل عمر المريض ويدل علي دلك المعادلة 0.0 الوضحت الدراسة زيادة النسبة بين حجم القلب وحجم الصدر في اشعة الصدر مع زيادة مقمة طول الموجة (ر) في التخطيط الكهربائي للقلب ممثلا في المعادلة 0.0 الضهرت المعادلة والسبة بين حجم القلب والصدر وص تمثل قمة الموجة ر. اظهرت الدراسة ان الموجةين الاكثر انحرافا في تطبيقات تخطيط القلب علي المرضي هما QRS والنساط البطينين الايسر والموجة مثل حالة انقباض البطين الايسر والموجة مثل النساط البطينين.

كما وجدنا ان غرفة القلب الاكثر تضخما هي البطين الايسر بنسبة 55% مقارنة ب 19 $^{\circ}$ 15% و 11% لكل من الادين الايسر البطين الايمن والادين الايسر على التوالى .

غالبية المرضي يعانون من زيادة الوزن بنسبة 45% والدين يعانون من السمنة نسبتهم 40% واصحاب الوزن المثالي بنسبة 15%. غالب المرضي اتي تصنيفهم في المرحلة الثالثة للمرض بنسبة 55% اما الدين صنفوا بالمرحلة الاولي فنسبتهم 2% والمرحلة الثانية 30% والمرحلة الرابعة 13%.

#### LIST OF FIGURES

| Figure | Figure Caption   | Page |
|--------|--|------|
| 2.1    | Percent distribution of hospitalization for CHF by age in years in USA during 2000 and 2010 (CDC/NCHS, National Hospital Discharge Survey, 2000–2010).   | 18   |
| 2.2    | shows the various causes of electrocardiographic ST segment depression. (A) ST segment depression related to non-infarction ischemia, horizontal in morphology. (B) Reciprocal ST segment depression in lead III in a patient with acute anterior wall AMI. (C) Lead V2 STD attributable to posterior wall AMI. (D) Digoxin effect (E) Left ventricular hypertrophy. (F) Left bundle branch block. | 19   |
| 2.3    | shows atrial fibrillation, Normal QRS duration, Left axis deviation (LAD) noted and Paced atrial rhythm  | 20   |
| 2.4    | shows an ECG with obvious Normal cardiac axis, Normal QRS duration, and Lateral wall infarction.   | 20   |
| 2.5    | Shows 5CXR findings: cardiomegaly, Edema and haziness of vascular margins.   | 21   |
| 2.6    | CXR finding: cephalization on vessels in upper lobes of the lungs which is more prominent as manifestation on pulmonary venous hypertension (vascular phase).  | 21   |
| 2.7    | CXR finding: Hilar fullness with haziness enlarged pulmonary veins with perivascular fluid collection leads to full hazy hilar and vessels   | 22   |
| 2.8    | CXR shows bilateral diffuse soft fluffy alveolar infiltrates with each other in abutterfly distribution (alveolar phase).  | 22   |
| 2.9    | CXR shows cardiomegaly, bilateral hilar congestion, fuzzy full hilum and bilateral pleural effusion.   | 23   |
| 4.1    | Shows the incidence percent of Heart Diseases (CHF) based on gender in Sudan 2015.   | 26   |
| 4.2    | Shows the Heart Diseases (CHF) distribution in Sudan based on age group during June 2014 – June 2015   | 26   |
| 4.3    | Shows the body mass index BMI and the relevant frequency% among population during June 2014 – June 2015.   | 27   |
| 4.4    | Shows the common cofactor for cardiovascular diseases among Sudanese population during June 2014-June 2015.  | 27   |
| 4.5    | Shows the incidence percent of Heart Diseases (CHF) in the states of Sudan during June 2015 up to June 2015.   | 28   |

| 4.6  | Shows the common types of Heart Diseases in Sudan during June 2015 up to June 2015           | 28 |
|------|--|----|
| 4.7  | shows the common symptoms of patient's Heart Diseases in Sudan during June 2014 – June 2015. | 29 |
| 4.8  | shows the correlation between the cardiothoracic ratio and the breathing rate                | 29 |
| 4.9  | shows the correlation between the respiratory rate/min and the age in years                  | 30 |
| 4.10 | shows the deviated wave of ECG for CHF patients distributed based on frequency%              | 30 |
| 4.11 | shows the heart chambers enlargement frequency % for CHF patients                            | 31 |
| 4.12 | shows the stages of CHF distributed based on frequency%                                      | 31 |
| 4-13 | Shows the correlation between the cardiothoracic ratio and the peak of the R wave.           | 32 |
