

الآية

بسم الله الرحمن الرحيم

قال تعالى :

﴿إِنَّ اللَّهَ عِنْدَهُ عِلْمُ السَّاعَةِ وَيُنزِّلُ الْغَيْثَ وَيَعْلَمُ مَا فِي الْأَرْحَامِ وَمَا تَدْرِي نَفْسٌ مَّأَدَا تَكْسِبُ غَدًا وَمَا تَدْرِي نَفْسٌ بِأَيِّ أَرْضٍ تَمُوتُ ۚ إِنَّ اللَّهَ عَلِيمٌ خَبِيرٌ﴾ (34)

صدق الله العظيم

سورة لقمان الآية(34)

Dedication

Dedicate this work:
To the soul of my father
To the soul of my wife
 To my mother
 To my children
 To all my family
... And my special ...

Acknowledgement

All my pleasure to those whom support and encouraged me throughout my graduate studies. My parents specially my mother, my brothers , my sisters and my friends.

All my pleasure to my supervisor associate professor Rawia abdelgani , Dr. Ali Suleiman , UZ: Ammar Adam and UZ: Mogahid Mohammed for their great support that they offered wich made the completion of this study possible.

All thanks to brothers engineers in the Ministry of Mining and Criminal Evidence Police for their continued support.

Abstract

Silicon dioxide nanoparticles, also known as silica nanoparticles or Nano-silica, are the basis for many a lot of biomedical research due to their stability, low cost and ability to be functionalized with a range of molecules and polymers.

Silicon Oxide Nanoparticles Applications:

Paint, plastic, rubber color and magnetic materials, in addition Nano-silica can be widely used in ceramics (sugar) porcelain, gypsum, batteries, adhesives, cosmetics, glass, steel, fiber glass, and many other fields of environmental protection products upgrading.

In this study, a different sample of silicon was selected to investigate the transmission of radiation by an ultraviolet spectrometer. Three samples of silicon dioxide were prepared. At different periods of curushing optical properties were studied, including the attenuation coefficient, absorption and transmission.

المستخلص

الجسيمات النانوية لثاني أكسيد السيليكون، والمعروفة أيضا باسم الجسيمات النانوية للسيليكا أو نانوسيليكا، هي الأساس لكثير من البحوث الطبية الحيوية نظرا لاستقرارها، وانخفاض ثمنها والقدرة على التفاعل مع مجموعة من الجزيئات والبوليمرات.

تطبيقات الجسيمات النانوية اكسيد السيليكون:

الطلاء والبلاستيك ولون المطاط والمواد المغناطيسية ، بالإضافة إلى ذلك، النانو السيليكا يمكن أن تستخدم على نطاق واسع في السيراميك والخزف والجبص والبطاريات والمواد اللاصقة ومستحضرات التجميل والزجاج والصلب والألياف والزجاج، والعديد من المجالات الأخرى في ترقية منتجات حماية البيئة.

في هذه الدراسة تم اختيار عينه مختلفة من السيليكون للتحقق من انتقال الأشعة بواسطة جهاز مطياف الأشعة فوق البنفسجة. تم تحضير ثلاث عينات من ثاني أكسيد السيليكون التي تم طحنها في فترات طحن مختلفة تم دراسة الخصائص البصرية لها، بما في ذلك معامل التوهين والامتصاص والانتقال.

List of Table

2.1	QYs of Si NPs conjugated with different functional groups.	16
3.1	Categorization of environmental colloids according to origin and composition	32
4.1	the relation between Absorption and attenuation coefficient for sample one (crushed for one minute)	61
4.2	the relation between Absorption and attenuation coefficient for sample two (crushed for two minute)	64
4.3	the relation between Absorption and attenuation coefficient for sample three (crushed for three minute)	67

List of Figure

2.1	Structure of SiO ₂	8
2.2	Original silicon surface	10
2.3	Grow an oxide layer.	10
2.4	Grow a second oxide layer.	11
2.5	(a) Correlation between average diameter and PL peak energy. (b) Correlation between the geometrical standard deviation o the ensemble PL spectral	13
2.6	(a) Photograph (under UV light) of H–Si QDs (left, red emission) and seven water soluble Si QDs (yielding seven distinct emission colors) (b) PL spectra of H–Si QDs (curve 1) and Si QDs of 0.5, 1.5, 3.5, 6, 9, 14, and 24 h oxidization (curves 2–8), respectively (excitation wavelength: 360 nm). (c) Plot of the oxidation time versus Si core size.	16
2.7	(a) and (b) Schemes of forward and backward measurements. (c) magnified dark-field microscope image of nanoparticle (d) Left axes show forward (green) and backward (blue) scattering intensities,	17
2.8	(color online) Cycling performances at current rates of 1/4 C and 1/2 C	22
2.9	(color online) TEM images of Si QDs in an SiO ₂ matrix, (a) low-magnification image an (b) high-resolution image. (c) One-sun illuminated I–V curves of four different (n-type) Si QD/ (p-type) c-Sisolar cells measured at 298 K	23
2.10	(a) Schematic plot of FET device. The channel dimensions are 200 μm_2000 μm and the source is grounded during (b) A 7-nm-thick Si NC film on an Au-coated Si wafer.(c) Drain current (I _d)–gate voltage (V _g) for two different 10–20 nm asdeposited Si NC FETs.(d) Drain current (I _d)–drain voltage (V _d) characteristics for two different 10–20 nm as-deposited Si NC FETs	25
2.11	(color online) (a) TEM image of Si NCs produced by	26

	HEMB for 3-h illumination. (b) UV–visible spectra of the reaction solution (after 2-h illumination) treated with Nash reagent for the determination of formaldehyde. As the arrow indicates, from the top to bottom, the line represents obtained UV–visible data in the presence of unmodified Si NCs with illumination, in the absence of illumination and in the absence of unmodified Si NCs, respectively. Inset: the concentration of formaldehyde as a function of reaction time	
2.12	(color online) Schematics for Si QDs of different diameters from different reactions.	27
3.1	Size domains and typical representatives of natural colloids and nanoparticles. Operationally defined cut-off is given for filtration at 0.45 μm	31
3.2	A diagrammatic representation of (a) a charged stabilized nanoparticle and (b) a sterically stabilized nanoparticle	38
3.3	A diagram showing a simplified summary of nanoparticle formation	41
3.4	Schematic representation of the interaction of engineered NPs with natural water components.	46
3.5	Variation in the structure of iron-oxide nanoparticles due to the interaction with SRHA molecules at pH 6 as observed by transmission electron microscope (a) FeO (100 mg l ⁻¹ Fe) and (b) FeO (100 mg l ⁻¹ Fe) + HA (5 mg l ⁻¹), scale bar = 100 nm	53
3.6	Schematic plot of pathways and important transformation reactions in the aquatic environment .	55
3.7	Particle filtration by (a) diffusion, (b) interception and (c) sedimentation (modified after Yao (1968))	57
3.8	Correlation between filtration factor and travel distance for a given deposition rate	58
4.1	Ultraviolet–visible spectroscopy-Different material	59
4.2	the relation between intensity and attenuation coefficient for sample one (crushed for one minute)	62
4.3	the relation between Absorption and attenuation coefficient for sample one (crushed for one minute)	63

4.4	the relation between intensity and wave length for sample one (crushed for one minute)	63
4.5	the relation between Wave length and Absorption for sample one (crushed for one minute)	64
4.6	t he relation between intensity and attenuation coefficient for sample two (crushed for two minute)	65
4.7	the relation between Absorption and attenuation coefficient for sample two (crushed for two minute)	66
4.8	the relation between Absorption and attenuation coefficient for sample two (crushed for two minute)	66
4.9	the relation between Wave length and Absorption for sample two (crushed for two minute)	67
4.10	the relation between intensity and attenuation coefficient for sample three (crushed for three minute)	68
4.11	the relation between Absorption and attenuation coefficient for sample three (crushed for three minute)	69
4.12	the relation between intensity and wave length for sample three (crushed for three minute)	69
4.13	the relation between Wave length and Absorption for sample two (crushed for two minute).	70
