Acknowledgements

First of all my thanks and gratefulness to my God ALLAH who has been supported me by power of believing by him to complete this study and for everything in my life.

I would like to express my indebtedness and deepest gratitude to Prof. Humodi Ahmed Saeed for his valuable advice, guidance, constructive criticism, valuable suggestions, and for time and efforts devoted in the supervision of this study.

My indebtedness and deepest gratitude to Prof. Talal A. Sallam for his valuable advice, guidance and constructive criticism, for valuable suggestions, and for time and efforts devoted in the co supervision of this study.

My deepest gratitude is also to Dr. Mogahed El Hassan for his help, in the co supervision of this study and valuable discussion.

My indebtedness and deepest gratitude to Prof. Elhag A/ Mahmoud Manour for his valuable advice and guidance.

I wish to express my deepest gratitude and appreciation to Dr Fauzy Barhim head of laboratory of AL-Thawra hospital for placing all facilities throughout the work, and also for his kindness and invaluable help.

I feel personally indebted thanks to Samar M. Saeed and Suhair Ramdan in the research lab. of Sudan University of Science and Technology for placing all facilities throughout the work, and also for their kindness and invaluable help

I would like to express my deepest gratitude and appreciation to Dr. Adel Al Shamiry and Dr. Khaled Al-Mmasany for their invaluable help of statistical analysis.

My deepest gratitude and special thanks to Abdullatif A I-Qubaty, Talal Al Kahtany, Abudu Al Ellah Al Hrazy, Tawifq Abdu-Shaif, Ahmed Adulwareth, Khaled, Abdulla Al Qubaty, Abulla Omer, Arwa, and all staff in the laboratory of AL-Thawra modern general hospital in Sana'a, University of science and technology hospital, Yemen German hospital in Sana'a, AL-Gomhori hospital in Aden governorate, AL-Wahda general hospital in Aden governorate, Public Health Central lab of Taiz, AL-Thawra hospital Taiz, Al Kendy hospital Taiz, Central public health laboratories in Aden and Taiz governorates for them kindness and invaluable help. And to all those who helped and cooperated with me during this work and specimen collection

Finally I would like to thank Ministry of public health for their financial support.

Abstract

Antibiotics-resistant is becoming one of the major health problem all over the world. The emergence of antimicrobial resistance is not a new phenomenon and has become as a snowballed given rise to several serious health problems concern with economic, social and political implications. The study was designed to determine antibiotic resistance among common pathogenic bacteria in Yemen as well as genes responsible for Extended Spectrum β - Lactamase (ESBL) in these bacteria.

A total of 950 clinical specimens were collected from three major Cities in Yemen. Viz: 1. Sana'a, 2. Aden, 3. Taiz . These specimens were cultivated on bacteriological media for primary isolation. The isolates were identified according to standard methods. Antimicrobial susceptibility tests were assessed according to the Kirby–Bauer method. ESBL-producers were determined by using double disc synergy test and confirmed by cephalosporin/clavulanate combination disks. The ESBL genes were identified by Polymerase Chain Reaction.

Among investigated specimens, *Escherichia coli* was the most common pathogens 117 (30.8%), followed by *Klebsiella pneumoniae* 107 (28.2%), *Staphylococcus aureus* 95 (25.0%), *Pseudomonas aeruginosa* 40 (10.5%), and *Proteus* spp. 21(5.5%). Study on antibiotic sensitivity revealed that, 62.3%, 35.8% and 1.9% of the isolates were sensitive, resistant and moderate sensitive to all antibiotics used in this study respectively. On the other hand, it was found that the antibiotic resistance was statistically significant($p < 0.0001$) among isolates of intensive care units and surgical ward.

The prevalence of ESBL producers was 35.4%. The difference between ESBL and non-ESBL producing pathogens was statistically significant ($p < 0.007$). *Klebsiella pneumoniae* was the most common organisms producing ESBL 51(47.9%), followed by *Escherichia coli* 45 (38.5%), *Proteus species* 2 (9.5%) and *Pseudomonas aeruginosa* 3(7.5%). The prevalence of ESBL production in Sana'a, Aden and Taiz was 43.9%, 24.6% and 27.9% respectively. Antibiotic resistance was seen significantly among ESBL producing isolates ($P < 0.0001$). Moreover, antibiotic resistance of all ESBL- producing isolates were statistically significant to all tested antibiotic ($p < 0.0001$) except impenem. The most frequent identified genes among (ESBL) isolates were *CTX-M* 73 (75.3%), followed by *TEM* 49 (50.5%) and *SHV* 15 (15.5%).

It was concluded that *Escherichia coli* were the most frequent pathogen in Yemen and the major causative agents of female urinary tract infections. *Staphylococcus aureus* was the most prevalence pathogen among outpatients with low resistance to antibiotics. *Klebsiella pneumoniae* was the predominant pathogens among inpatients with high resistance to antibiotics. The major source of ESBL-producers was intensive care units and surgical words. All isolates were susceptible to impenem (100%).

This study is considered as the first document on the prevalence of ESBLs and their epidemiological distribution in Yemen. More studies are needed to confirm and enrich the data obtained during this research.

المستخلص

إن مقاومة البكتريا للمضادات الحيوية أصبحت واحدة من المشكلات الصحية الرئيسية فيا كل بلدان العالم. وظهورها ليست ظاهرة جديدة إذ أنها ستبقى معنا وهي ذات خطر متزايد. وترتبط بالوضع الاقتصادي والاجتماعي والسياسي.

صممت هذه الدراسة بغرض تحديد نسبة مقاومة البكتيريا للمضادات الحيوية وتحديد جينات إنزيمات البيبتالاكتام الممتدة الطيف المسؤولة عن هذه المقاومة.

خلال فترة الدراسة تم جمع 950 عينة سريرية من ثلاث مدن رئيسية في اليمن وهي 1. صنعاء 2. عدن 3. تعز. استزرعت هذه العينات وتم عزل البكتيريا والتعرف عليها باستخدام الطرق المعيارية ومن ثم إجراء اختبارات حساسيات العزلات للمضادات الحيوية باستخدام طريقة كيربي-باير. تم الكشف عن البكتريا المنتجة لإنزيمات البيبتالاكتام الممتدة الطيف بالطرق المعيارية باستخدام اختبار أقراص التآزر المزدوج والطرق التأكيديّة باستخدام طريقة اختبار القرص المتمازج للسيفالوسبورين مع حامض الكلفيوليك فيما تم تحديد عن جينات إنزيمات البيبتالاكتام الممتدة الطيف باستخدام تفاعل البلمرة المتسلسل.

من العينات التي شخّصت كانت الاشريكية القولونية هي أكثر العزلات انتشاراً 117 (30.8%) يليها الكلبسيلا الرئوية 107 (28.2%) والمكورات العنقودية الذهبية 95 (25.0%) والزائفة الزنجارية 40 (10.5%) و المتقلبة 22 (5.5%).

أظهرت نتائج الدراسة أن نسبة 62.3% و 35.8% و 1.9% من العزلات كانت حساسة ومقاومة ومتوسطة التحسس على التوالي لكل المضادات الحيوية التي اشتملت عليها هذه الدراسة. من جهة أخرى فقد كانت المقاومة للمضادات الحيوية ذات دلالة إحصائية ($p < 0.0001$) في العزلات من قسم العناية المركزة والجراحة.

كانت نسبة انتشار البكتيريا المنتجة لإنزيمات البيبتالاكتام الممتد الطيف 35.4% وكان الفرق بين البكتيريا المنتجة وغير المنتجة لإنزيمات البيبتالاكتام الممتد الطيف له دلالة إحصائية ($p < 0.0001$). كانت الكلبسيلا الرئوية أكثر العزلات منتجة لإنزيم البيبتالاكتام 51 (47.7%) يليها الاشريكية القولونية 45 (38.5%) و المتقلبات 2 (9.5%) والزائفة الزنجارية 3 (7.5%). كما وجد نسبة انتشار البيبتالاكتام في كل من مدينة صنعاء وعدن وتعز 43.9% و 24.6% و 27.9% على التوالي.

مقاومة المضادات الحيوية كان له ارتباط ذو دلالة إحصائية في العزلات المنتجة لإنزيم البيبتالاكتام الممتد الطيف ($P < 0.0001$). نتائج هذه الدراسة أظهرت أن كل البكتيريا المنتجة لإنزيم البيبتالاكتام الممتد الطيف كانت لها دلالة إحصائية في مقاومة المضادات الحيوية ($p < 0.0001$) باستثناء للامبينيم.

كان جينات *CTX-M* أكثر الجينات إنتشاراً بين العزلات 73 (75.3%) يليه *TEM* 49 (50.5%) وأخيراً *SHV* 15 (15.5%).

يستنتج من هذه الدراسة أن الاشريكية القولونية أكثر العزلات إنتشاراً في اليمن وأهم العوامل الممرضة لالتهابات المجاري البولية. كما أن المكورات العنقودية المذهبة أكثر إنتشاراً في أوساط الحالات المرضية من خارج المستشفيات وأقلها مقاومة للمضادات الحيوية. بينما الكلبسيلا الرئوية كانت أكثر إنتشاراً داخل

المستشفيات والمسببة للالتهابات الرئوية وأكثر العزلات مقاومة للمضادات الحيوية مقارنة بالأنواع الأخرى .
كل العزلات البكتيرية أعطت حساسية عالي للامبينيم (100%).
تعتبر هذه الدراسة أول توثيق لمعدل إنتشاراً أنزيم وجينات البييتالاكتام ولانتشار الوبائي له ففي اليمن. وان
دراسات أخرى مطلوبة لتأكيد وإثراء المعلومات التي تم الحصول عليها في هذا البحث.
