أعوذ بالله من الشيطان الرجيم

بسم الله الرحمن الرحيم

((ولقد صرفناه بينهم ليذكروا فأبى أكثر الناس إلا كفورا))

صدق الله العظيم

من الآية (٥٠) سورة الفرقان

Dedication

I dedicate this work to the soul of my parents the compassionate

*To my wonderful and lovely wife for her patience, encouragement and
continues support*

*To my children Mohamed, Elmoothanna and my sweet twins for
dreaming proudly about their father holding a PhD degree*

To my brothers and sisters

To my best friends for their Cheers

Acknowledgements

My deepest appreciation and sincerest gratitude to my Supervisor Prof. Mohamed Omer Mohamed Yousif for his scientific continuous support throughout this research I cannot thank him enough for these efforts on this project. I would also like to thank my Co Supervisor Dr. Babikker A-Wahab for his constant guidance, encouragement, and for sharing his valuable experience.

Thanks to all of my colleagues and friends in Diagnostic Imaging Department Ribat University Hospital, for their co-operation in collecting and providing a pleasant environment for my research. Thanks to all staff of collage of Medical Radiological Sciences in Sudan University in Science and Technology .Especially thanks to Dr. Ahmed Abukonna, Dr.Asmaa, Dr Ikhlas, Prof. Mohammed Elfadil, Dr . Mona Ahmed and Prof. Elsafi Ahmed for their energetic contribution in evaluation process. Also my thanks go to afro-Asian centre dean Dr Elsir Ali Saeed for great efforts and support. Thanks to collage of Medical Diagnostic Imaging in Ribat Universty namely Dr Abdelrahman M. Noor, for his ideas and comments. I feel debit to Dr. Mustafa Z. Mahmoud and Dr Salah Kurgweel from Fedail hospital.

I would like to thank my friends for providing a pleasant environment for my research. I thank to lots of people that were kindly and peacefully participating in my subjective experiments.

ABSTRACT

Early identification of deep venous thrombosis (DVT) in trauma patients would result in an early initiation of treatment, thereby decreasing the frequency of complications. The aim was to study the deep vein thrombosis in fractured lower extremities using Duplex ultrasonography

This prospective study was carried out at Ribat Universal Hospital in Khartoum Sudan from January 2016 and March 2018 included 176 patients (129 males and 47 females; mean age of 51.5 ± 19.5 years) with fractured lower extremities were thoroughly evaluated by Doppler exam with respect to fracture site and pattern, fixation type, associated injuries, time before immobilization, and venous Duplex ultrasound (VDUS) findings. Each affected limb was assessed for the presence of DVT using a Sonoline G 60S ultrasound (US) unit. The analysis was performed with the Statistical Package for the Social Sciences (SPSS) version 22.

The incidence of DVT in the current study was (12.5%) the high rates of DVT noted in 10 (16.4%) patients with age group (58-77) years old, 10 (13.7%) patients with periacetabular fractures, 5 (20%) patients with femur fractures, 3 (23.1%) patients with multiple fractures, 6 (20%) patients with late immobilization more than 10 hours, 3 (42.9%) patient with TBS fixation and 3 (23%) patients having multiple fractures. Sensitivity and specificity of the findings of compressibility and respiratory phasicity for DVT detection in patients with fractured lower extremities were 81.25% and 87.50% and 100% and 100% respectively. In addition, the absence of compressibility and phasicity had positive predictive value (PPV) of 100% and 100% and negative predictive value (NPV) of 93.75% and 95.65% respectively.

In this study the rate of DVT was high on complex fractures, delayed immobilization and on fractures that immobilized by traditional bone setter (TBS). US exam of DVs in the brightness mode (B-mode) with compression maneuvers should be the first-line imaging modality for suspected DVT in patients with fractured lower extremities.

ملخص البحث

إن التشخيص المبكر للجلطة الوريدية العميقة (DVT) في مرضى الحوادث قد يؤدي إلى البدء المبكر للعلاج ، وبالتالي تقليل تكرار المضاعفات. كان الهدف هو دراسة تجلط الأوردة العميقة في الأطراف السفلية المكسورة باستخدام الموجات فوق الصوتية دوبلكس .

أجريت هذه الدراسة الاستباقية في مستشفى الرباط الجامعي في الخرطوم السودان من يناير ٢٠١٦ إلى مارس ٢٠١٨ وشملت ١٧٦ (١٢٩) من الذكور و ٤٧ من الإناث ؛ متوسط العمر ٥١,٥ ± ١٩,٥ سنة) مصابا بكسور الاطراف السفليه تم تقييمهم بدقة من خلال فحص الدوبلر فيما يتعلق بموقع و نمط الكسر ، نوع التثبيت ، الإصابات المصاحبة ، المدة الزمنية قبل التثبيت ، و نتائج الموجات فوق الصوتية الوريدية (VDUS) تم تقييم كل طرف مصاب من أجل وجود DVT باستخدام جهاز الموجات فوق الصوتية Sonoline G 60S تم إجراء التحليل باستخدام الحزمة الإحصائية للعلوم الاجتماعية (SPSS) الإصدار ٢٢

كان معدل الإصابة بجلطات الاوردة العميقة في الدراسة الحالية هو (١٢,٥ ٪). لوحظ ارتفاع معدلات تجلط الأوردة العميقة في ١٠ (١٦,٤ ٪) من المرضى الذين تتراوح أعمارهم بين (٥٨-٧٧) سنة ، ١٠ (١٣,٧ ٪) من المرضى الذين يعانون من كسور حول المخروقة ، ٥ (٢٠ ٪) من المرضى الذين يعانون من كسور عظم الفخذ ، ٣ (٢٣,١ ٪) من المرضى الذين يعانون من كسور متعددة ، ٦ (٢٠ ٪) من المرضى الذين يعانون من التثبيت المتأخر للكسر أكثر من ١٠ ساعات، ٣ (٤٢,٩ ٪) من مرضي التثبيت بالجبيره البلديه و ٣ (٢٣ ٪) من المرضى الذين يعانون من كسور متعددة. كانت حساسية وخصوصية نتائج الانضغاطية والطور التنفسي للكشف عن الإصابة بجلطات الاوردة العميقة في المرضى الذين يعانون من كسور الأطراف السفلية ٨١,٢٥ ٪ و ٨٧,٥٠ ٪ و ١٠٠ ٪ و ١٠٠ ٪ على التوالي. بالإضافة إلى ذلك ، كان لغياب الانضغاطية والطور التنفسي القيمة التنبؤية الإيجابية (PPV) من ١٠٠ ٪ و ١٠٠ ٪ والقيمة التنبؤية السلبية (NPV) من ٩٣,٧٥ ٪ و ٩٥,٦٥ ٪ على التوالي .

في هذه الدراسة وُجد أنّ معدل الإصابة بتجلط الأوردة العميقة مرتفع عند الكسور المعقدة والمتأخرة التثبيت وعلى كسور الجبيره البلديه. إن فحص الجلطة العميقة DVT بالموجات فوق الصوتية العادية في وضع السطوع (B-mode) مع مناورات الضغط يجب أن يكون هو الخط الأول لتصوير المرضى المشتبه بهم الذين يعانون من كسور الأطراف السفلية
