

## المستخلص

يعد توفير السكن لذوى الدخل المحدود أحد التحديات الرئيسية التي تواجه الحكومات في البلدان النامية، بما فيها دولة السودان. ويمكن أن تعزى مشكلة الإسكان الحادة في السودان إلى عدد من المشاكل منها الافتقار إلى التمويل ونقص مواد البناء، ونقص القوى العاملة ذات الخبرة، ومحدودية تكنولوجيا البناء ومدى استيعابها، وسوء وسائل النقل وغيرها من المشاكل.

وتهدف الدراسة إلى دراسة إمكانية استخدام تكنولوجيا البناء الصناعية كحل بديل لحل مشكلة مساكن نو الدخل المنخفض السودان. حيث تتألف المنهجية من خلفية نظرية (استعراض البيانات - المؤلفات) والمقابلات، ودراسة الحالة، واستبيانات الدراسات الاستقصائية، والتحليل والتقييم. وأخيراً، تم استخدام استبيانات الدراسة الاستقصائية في تطبيق المصفوفة المطورة من خلال تقييم أداء أنظمة البناء التقليدية والصناعية، وفقاً لكل عامل من عوامل المعايير المحددة. وتم تحليل البيانات كماً ونوعاً لتحديد جدوى أي من نظامي البناء لإسكان الفقراء في السودان. وتتألف الدراسات الاستقصائية على ثلاثة جوانب، وهي: تطوير إطار التحليل، وصياغة وإجراء/إصدار المقابلات والاستبيانات. مصفوفة الجدوى المقارنة للمعايير المتعددة (MCCFM) هي أداة التحليل المعتمدة للتحليل والمقارن بين نظامي البناء التقليدي والصناعي ويعتمد المسح الميداني على أداة التحليل MCCFM، حيث تضيف المقابلات جانباً من جوانب الأهمية وتوفر الاستبيانات جانباً من جوانب الأداء. والدراسات الاستقصائية هامة إذ يجب تحليل العوامل من خلال أدائها لأي من نظامي البناء.

ويتألف هدف تحليل البيانات على ثلاثة جوانب، والهدف من تحليل البيانات هو: تطبيق إطار التحليل، رسماً بيانياً للنتائج والتعليق والتحليل على النتائج. ويتطلب تطبيق إطار التحليل معالجة البيانات التي تم الحصول عليها من المقابلات والاستبيانات وتطبيق هذه البيانات في أداة التحليل MCCFM بحيث تستمد قيمة نهائية تعكس قيمة الجدوى. وكما هو واضح، تعكس المقابلات الأهمية في حين تعكس الاستبيانات الأداء. تتم معالجة البيانات الأولية التي يتم جمعها من المقابلات عن طريق تحويل البيانات إلى معايير تناسبية، ثم ضرب القيم في مقابل متوسطات فئة العامل الأساسي المعنية ثم ضربها مرة أخرى مقابل قيمة العامل الأساسي. وMCCFM يضاعف قيم الأهمية مع قيم الأداء؛ ويتم ذلك لكل عامل من عوامل المعايير ولكل نظام بناء على التوالي. وهدف تحليل البيانات يتكون من ثلاثة جوانب هي تطبيق إطار التحليل، ورسم بياني للنتائج والتعليقات والتحليلات على النتائج. تطبيق إطار التحليل يستلزم معالجة البيانات التي تم الحصول عليها من المقابلات والاستبيانات وتطبيق هذه البيانات في أداة تحليل MCCFM بحيث تستمد قيمة نهائية تعكس قيمة الجدوى، وتظهر النتيجة درجة لكل عامل لكل نظام بناء. ويتم ذلك لكل من المصفوفات الثلاثة (الحكومة والمقاول والمستخدم النهائي). وتعكس النتيجة قيمة كل نظام بناء مع المعايير ذات الصلة. يتم تجميع هذه الدرجات معاً للحصول على نقاط نهائية لكل مجموعة من المصفوفات الثلاثة، ثم يتم جمع هذه الدرجات معاً لاستنباط نتيجة نهائية للدراسة بأكملها. ويعتبر نظام البناء ذو الأعلى درجة الخيار الأفضل.

وتوصي الدراسة بأن تعتمد الحكومة تكنولوجيا البناء الصناعي كحل فعال وبديل لإسكان الفقراء في السودان. كما تهدف الدراسة إلى دعم المبادرات الحكومية لإيواء الفقراء في السودان. إن العمل البحثي المقدم في هذه الدراسة حقيقي ولم يسبق له مثيل في السودان، ونتائج الدراسة قابلة للنقاش إلى حد كبير بسبب أهميتها، وأهميتها لأهداف الإسكان المدعوم من الحكومة، وأثارها الفعالة على المبادرة، وأدائها للإسكان لذوى الدخل المنخفض في السودان.

**الكلمات الرئيسية:** الإسكان الاجتماعي، نظام البناء التقليدي، نظام البناء الصناعي، الأدوات التحليلية، التنمية المستدامة.

# Abstract

Housing provision for the poor is one of the major challenges facing governments in developing countries including Sudan. The acute housing problem in Sudan can be due to a number of limitations including lack of finance, shortages of processed building materials, lack of experienced labor force, limited construction technologies, and poor transportation means.

The aim of this research is to investigate the potential of industrialized building technology for low-cost housing provision in Sudan. The methodology consists of a theoretical background (2<sup>nd</sup> hand data - literature review) and 1<sup>st</sup> hand data (interviews, case study, and survey questionnaires); analysis, and evaluation. Finally, a survey questionnaire is used to apply the developed matrix through rating the performance of conventional and industrialised building systems according to each factor of the identified criteria. Data will be analysed quantitatively and qualitatively to identify the feasibility of either building system for housing the poor in Sudan.

The study surveys are comprised of three aspects; developing the analysis framework, formulating and conducting/issuing, both the interviews and the questionnaires. The Multi-Criteria Comparative Feasibility Matrix (MCCFM) is the analysis tool adopted for comparative analysis between the two building systems. The survey is based on the MCCFM tool as the interviews add an aspect of importance and the questionnaires provide an aspect of performance. The survey is important as the factors must be analysed through the performance of either building system.

The Data analysis objective is comprised of three aspects, thus; applying the analysis framework, graphing the results, and commentary, and analysis on the results. Applying the analysis framework entails the processing of the data obtained from the interviews and questionnaires and applying such data into the MCCFM analysis tool so that it derives a final value that reflects the value of the feasibility. The MCCFM multiplies the values of importance with the values of performance; this is done for each factor of the criteria and for each building system respectively.

The conclusions score for each respective factor of each building system. This is done for each of the three matrices (government, contractor, and end-user). The score reflects the value of each building system with the respective criteria. These scores are summed up together to derive a final score for each perspective group, then those scores are summed together to derive a final score for the whole study. The building system with the highest score is deemed the best option.

The study recommends that the government adopt industrial building technology as an effective and alternative solution for housing the poor in Sudan. The study also aims to support government initiatives to house the poor in Sudan. The research work presented in this study is real and has never been done before in Sudan. The results of the study are highly debatable because of its importance, its importance to government-subsidized housing objectives, its effective effects on the initiative, and its performance for low-income housing in Sudan.

**Keywords:** Social housing, Conventional construction system, industrial construction system, analytical tools, sustainable development.

# Acknowledgement

First and foremost, I would like to thank God Almighty for giving me the strength, knowledge, ability and opportunity to undertake this research study and to persevere and complete it satisfactorily. Without his blessings, this achievement would not have been possible.

In my journey towards this degree, I have found a teacher, a friend, an inspiration, a role model and a pillar of support in my Guide, my supervisors **Prof. Dr. Awad. H. Saad** the vice manager of Sudan University of Science and Technology. He has been there providing his heartfelt support and guidance, inspiration and suggestions in my quest for knowledge. He has given me all the freedom to pursue my research, while silently and non-obtrusively ensuring that I stay on course and do not deviate from the core of my research. Without his valuable guidance, this thesis would not have been possible and I shall eternally be grateful to him for his assistance.

I would like to thank a number of people who have contributed to the final result of my study in many different ways. Special thanks are due to **Dr. Khadiga M. Osman**, who provided exceptional support and guidance. Also, I convey special thanks to **Dr. Mohammed Mahdi**, for his abundantly helpful and offered invaluable assistance, support and guidance throughout this dissertation. Also, I wish to express my deepest gratitude to my colleagues at the Technology Science University College of Architecture and Spatial Planning for the all the information they provided.

It would be inappropriate if I omit to mention the names of my dear friends Isam Hassan, Ahamed Altayeb Hassan, Ayman Hamed, and Hisham Ali who have, in their own ways, kept me going on my path to success, assisting me as per their abilities, in whatever manner possible and for ensuring that good times keep flowing. I would like also to express gratitude to all my colleagues in and out of the Sudan for their enormous help in collecting the surveys and their participation in the questionnaires and their support.

My deepest love and gratitude to my family, my parents, brothers, my wife, and my lovely daughter Lujain and Layan for inseparable support, encouragement, unwavering faith and endless love, through the entire period of my study.

Finally, completing a PhD is of course a long journey throughout a battlefield, and I would not have been able to come to its end without the support and assistance of many people. I am attempting to convey my appreciation for those people who directly or indirectly contributed to the completion of my dissertation, and I am apologetic for not mentioning them personally one by one.

## **Dedication**

To all those who I love, and to all those who are looking for better future, I dedicate this work.

With my love.

Omer
