**Estimation of Pore Pressure Regime - Bentiu1  
Formation - A Sudanese reservoir**

**الرسالة المقدمة - ١ رسالاتى رسالى - رسالى رسالى رسالى**

**A THESIS SUBMITTED IN PARTIAL FULFILMENTS FOR  
THE DEGREE OF M.SC IN PETROLEUM ENGINEERING**

**(DRILLING ENGINEERING)**

**M.Sc Candidate:**

**Ayah Abdelhai Fadlallah Hussein**

**Supervised:**

**Dr. Ahmed Abdel Aziz**

**October, 2012**

## **Dedication**

I would like to dedicate this thesis to Lovely & Kindly hearts who support me along all my life:

My Mum & Dad

, Husband

, Son

, Small Family, Big Family

& friends

## **Acknowledgements**

In the name of Allah the Most Gracious, the Most Merciful

First and foremost, I would like to thank my Creator for giving me a still functioning body and mind in order to live life and learn, and particularly to work on my dissertation project, hereby completing my Master's studies.

I give my high, respectful gratitude to my supervisor Dr. Ahmed Abdel Aziz for his great assistance and support during this thesis project.

Great endless thanks to Dr. Tagwa Musa for her useful guidance, efforts, suggestions, and without her help this work would be less useful and less complete.

## **ABSTRACT**

This research provides a practical simple numerical equation for estimating pore/formation pressure in “Bentiu-1 formation - Bamboo West field”. The base of the work is the ratio between the pressure (P), Bulk density ( $\rho$ ), Depth (h) and the acceleration gravity (g), where the terms ( $\rho$ ) and (h) represented by: Deep resistivity , Sonic and Bulk density logs data.

Two different numerical methods were used to generate the final equation and “Error Analysis” was done to compare between them and reach the best model. Then “Surfer-8” software was used to create the pore pressure distribution contour map of the study area.

This method can be applied during the early life of proposed oil field to give an initial prospective of how much pressure distribution could be within any formation since the field has no enough data for using other methods. Also this new method will save cost and time and considered as a huge and real plus to oil industry in Sudan for the best sake and development of our own country.

The study shows that both sonic and resistivity log data can be used to estimate the pore pressure for this formation with 1.13% and 1.16%, respectively, using mean absolute percentage error (MAPE). And the calculated pressure distribution contour maps for both Sonic and Resistivity equations, using Surfer software, are look similar to those plotted for the real pressure in Bentiu-1 formation.

## مقدمة

تم في هذا البحث إيجاد معادلة رياضية عملية وبسيطة لتقدير الضغط الطبقي لطبققة بانتيو-1 بحقل بامبو غرب النفطي. أساس هذا العمل هو العلاقة التي تحسب قيمة الضغط اعتدالا على: عجلة الحاذبة الأرضية ((g، الكثافة (ρ) ) والعمق (h) . حيث تم تعويض كل من الكثافة والعمق كدول في بعض تسجيلات الآبار وهي: تسجيلات المقاومة (Re) ، تسجيلات الصوت (Dt) والكثافة (ρ).

تم استخدام طريقتين حسابيتين لإيجاد المعادلة ومن ثم حساب قيمة الخطأ بفرض الحصول على أفضل معادلة. وبعد ذلك تم رسم خرائط توزيع الضغط الطبقي للمنطقة باستخدام البرنامج الحاسوبي "سيرفر-8".

يمكن تطبيق هذه الطريقة منذ البداية لاعطاء توقعات للضغط في المنطقة المحددة إذا لم تتوفر معلومات أو إمكانيات لتطبيق طرق أخرى. وهذه الطريقة الجديدة ستقلل من التكلفة والزمن وتعتبر إضافة قيمة للصناعة النفطية في السودان.

هذه الدراسة خلصت إلى إمكانية استخدام تسجيلات المقاومة والصوت في حساب الضغط الطبقي لهذه المنطقة بخطأً متوسط مطلق نسبي مقداره 1.13% و 1.16% على التوالي. ووجد بأن خرائط توزيع الضغط الطبقي المحسوب باستخدام معادلتي تسجيلات المقاومة والصوت يشابه توزيع الضغط الذي قياسياً للمنطقة مسبقاً.
