

DEDICATION

To the Great prophet Mohammed
(peace and prayers be Upon him)
To my family, friends for their moral
support and encouragements.
To all farmers (gum gardens owner)
in Sudan.

Gammer-eldien Abdel Rahman

ACKNOWLEDGMENT

I would like to thank professor. Hassan Abdel Rahman Musand my main supervisor and Dr. Ibrahim Ali ElBahar and Dr. Mohammed Mukhtar Ballal the co-supervisors for their valuable suggestions in putting out the broad line of the research, clear guidance, continuous support, patience and criticism. Great thanks and special appreciations to Sudan University of Science and Technology represented by the college of Forestry and Range Science which has given me the opportunity to study for the degree of Doctor of philosophy . Moreover, my gratitude and recognition to Dr Abdel Hafeez Ali, Dr. Abdel aziz Karamalla, Dr. Farah Yousif for their help, comments and assistance. Also my thanks are extended to Mr. Osama Taj Elsir, FNC manager in North Kordofan state for assisting in data collection. I would like also to express my gratitude to the farmers at Elobied, El Rahad and Um Rawaba who patiently responded to my questions and interviews.

Sincere thanks are due to my colleagues, Mr Mahel Mohammed, Abdel El Monium , Mohammed Bakheet, El Khatium Maki and the driver Mr. Hamid for their friendly assistance during the field work. Thanks are also extended to my brothers, Mr Maaz, El Hadi and Lougman Abdel Rhaman . I deeply appreciate and thank my relatives and close friends specially Mr Faisal Mohammed, Mahgoub Suliman, Hessien Abdelallah and Ms. Nancy Ibrahim, Wafa Hamed for their invaluable help, endless patience in data analysis and typing this research.

Thanks are extended to all those who assisted and contributed with me till the accomplishment of this word.

I thank Allah, The merciful and gracious for giving me the health and power.

ABSTRACT

Effects of Some Ecological and Socio-economic Factors on Sustainable Management of *Acacia senegal* var. *senegal* In North Kordofan State

This study was conducted at ElObied, ElRahad and UmRawaba areas in North Kordofan State. The objectives were to determine the current condition of *Acacia senegal* growing stock and its management for gum production; to investigate the farmers perception, awareness and attitudes towards better conservation and management of the tree. The aim was to formulate a strategy and approaches for improving the management of the tree for sustainable production of gum arabic.

Stratified random sampling techniques were followed to select nine villages (three in each area) on the basis of population size. To determine the stocking, regeneration and growth parameters, 27 sample plots (17.8m is radius of a circle) were randomly selected to represent stocking densities of the tree stands.

A social survey was carried out in the nine villages. The sample size of respondents was proportional to the size of villages. A total of 90 respondents constituting 10% of population were randomly selected to investigate the socio- economic aspects of gum production.

The study showed that the condition of growing stock of the *Acacia senegal* tree in terms of crown and height development, differs according to the density of stands. The management of the tree at UmRawaba area seems to be in favor of stand development and improvement. For example, the overall mean stocking in this area was 295 trees/ha compared to 182 trees /ha and 140 trees /ha at El Obied and ElRahad areas, respectively.

The results also showed that the *Acacia senegal* stands were mature or over-mature with an average crown diameter of 5.0 m and a height of 5.4m. More than 70% of the interviewed farmers expressed great interest in tree planting, protection and management of gum arabic tree for improving their livelihood, enhancing agricultural environment and achieving ecological stability.

The cooperative societies in the area were found to play a vital role in backing up the farmer's tree-management interventions. The study revealed that the area under the Hashab tree declined sharply from 50 Mukhamas (36.5ha) to less than 10 Mukhamas (7.3ha) per person at present, and the average amount of gum produced per tree ranges from 500-1000g.

The low density of the tree cover in some of the areas was due to the abandonment of the traditional bush-fallow system where only 10% of farmers practice this system. The feasibility of gum arabic price seems to be the driving force of adopting the system or otherwise. Therefore, the study recommends adoption of new approaches for the improvement of the existing farm management systems through a balanced integration of *Acacia senegal* with field crops using sound agroforestry practices in North Kordofan State.

بسم الله الرحمن الرحيم

ملخص الدراسة

أثر بعض العوامل البيئية وإقتصادية إجتماعية على الإدارة المستدامة لأشجار الهشاب بولاية شمال كردفان

أجريت هذه الدراسة بمناطق ام روابه، الرهد والأبيض بولاية شمال كردفان. هدفت الدراسة لتحديد الوضع الراهن للمخزون الشجري للهشاب في المشاجر الطبيعية ومعرفة الأنماط المتبعة في إدارتها. كما هدفت الدراسة للتحقق من مستوى الوعي وإنطباعات المزارعين وسلوكهم تجاه المحافظة وإدارة أشجار الهشاب. أما الهدف الرئيسي لهذه الدراسة هو إستنباط إستراتيجيات ومفاهيم للإدارة المستدامة لشجرة الهشاب لإنتاج الصمغ العربي

تم إستخدام طريقة العينة العشوائية الطبقية لإختيار تسع قرى وذلك بناءً علي عدد السكان في كل من المناطق الثلاث ولتحديد الكثافة الشجرية (tree stocking) والتجديد الطبيعي وخصائص النمو لأشجار الهشاب، تم إختيار 27 عينة عشوائية دائرية (بنصف قطر 17.8 متر) لتمثل الكثافات الشجرية المختلفة للهشاب.

أجرى مسح إقتصادي وإجتماعي للمزارعين فى التسع قرى، وأخذت عينة عشوائية طبقية بنسبة 10% من جملة عدد سكان الأسر حسب حجم كل قرية ليصبح عدد المستهدفين حوالي 90 مزارع.

أوضحت الدراسة أن الوضع الراهن للمخزون الشجري للهشاب، علي حسب خصائص النمو المتمثلة في إرتفاع الأشجار وقطر التاج، يختلف حسب كثافة المشاجر. وتبعاً لذلك يبدو أن نظام إدارة أشجار الهشاب في منطقة ام روابه يؤدي إلي تحسين وتطوير المجاميع الشجرية. إذ نجد أن متوسط كثافة الأشجار في الهكتار تتفاوت من منطقة لأخرى، حيث تعتبر منطقة أم روابه ذات كثافة شجرية عالية تمثل 295 شجرة/هكتار مقارنة بكثافة 182 شجرة/هكتار و 140/هكتار في كل من الأبيض والرهد علي التوالي.

أظهرت النتائج كذلك أن أشجار الهشاب في المشاجر الطبيعية ذات أعمار كبيرة حيث أن متوسط قطر التاج حوالي 5.0 m، أما متوسط الارتفاع فيبلغ حوالي 5.4 m.

أكدت الدراسة بان أكثر من 70% من المزارعين المستهدفين لهم الرغبة الشديدة فى زراعة أشجار الهشاب و حمايتها وإدارتها لتحسين مستوى معيشتهم مع تحسين البيئة الزراعية لتحقيق إستقرار النظام البيئي.

وجد أن جمعيات المنتجين في بعض مناطق الدراسة لها دور كبير وفعال في توعية المزارعين وذلك من خلال تشجيعهم وإستيعابهم للمشاركة في إدارة

أشجار الهشاب. كما أظهرت الدراسة بان هنالك نقصاً حاداً في المساحات المغطاة بأشجار الهشاب بالنسبة للمزارعين، حيث تقلصت مساحة الغطاء الشجري من 50 خمس (36.5 هكتار) إلي أقل من 10 خمس (7.3 هكتار) في الوقت الراهن وأن متوسط إنتاج الشجرة الواحدة من الصمغ في الموسم يتراوح ما بين 500 - 1000 جرام.

أيضا أظهرت النتائج بأن إنخفاض كثافة الغطاء الشجري للهشاب في بعض مناطق الدراسة، يعزى إلي عدم تطبيق نظام الـ (Bush-Fallow system) وأن حوالي 10% فقط من المزارعين يمارسون هذا النظام. كما أن أسعار الصمغ العربي أحيانا تبدو من المحددات لتبنى هذا النظام أو تجاهله من قبل المزارعين.

أوصت الدراسة بضرورة تبني مفاهيم جديدة لتطوير النظم الحالية المتبعة في إدارة جائن الهشاب وذلك من خلال إستحداث نظام تكاملي متوازن للهشاب والمحاصيل الحقلية (A balanced integration of *Acacia senegal* with field crops) في ممارسة سليمة لانظمة التكامل الزراعي الغابي بولاية شمال كردفان.

GLOSSARY

Density: is the number of individual of species per unit area.

Cover: is the proportion of the ground that has a cover of a certain species and would be shaded by it's the individual, or it is the proportion Occupied by species related to the ground surface, but in woody vegetation.

Fallow period: is a piece of land where no crops have been planted so that the soil has a chance to rest and improve.

Plot: is a part of the area of forest demarcated or by inventory

Stand: is an area of growing trees in forest land, elite stand or full stand

Regeneration: the renewal of forest trees.

Farming system: complex of different human activities to exploit the environment, growing crops, keeping animals etc

Shifting cultivation: System of land use in which short periods of cropping alternate with long fallow periods during which the soil fertility recovers.

Mukhammas: An area which equivalent 7350 square meter
