فَتَعَالَى اللَّهُ الْمَلِكُ الْحَقُّ ^{قُلْ} وَلَا تَعْجَلْ بِالْقُرْآنِ مِنْ
قَبْلِ أَنْ يُقْضَىٰ إِلَيْكَ وَحْيُهُ وَقُلْ رَبِّ زِدْنِي عِلْمًا

سورة طه- الآية (114)

**To my parents, Mirghni and Khaddegia , who
-have given me the best values in life**

ACKNOWLEDGMENTS

This thesis is a result of the motivation and support provided by many individuals. Firstly, I want to thank my thesis advisor **Dr. Awad Mohamed Awadalkarim** for his continual support, encouragement, and guidance

To my parents, **Mirghni and Khaddegia**, who continues to learn, grow and develop and who has been a source of encouragement and inspiration to me throughout my life, a very special thank you for providing a 'writing space' and for nurturing me through the months of writing

I'm thankful for the helpfulness of many others in putting together various pieces of this thesis, including my department's team

A huge thank-you to my sister's, **Samira, Huda, Laila, Ruda** and my brother's **Rodowan, Amir, and Yasser** for your tireless encouragement and prayers

To my dear friends, **Rasha, Suad, and Ebtisam** for their contribution to me in the ideas and support

To my dear husband, **Ibrahim** who remains encouraged me in the completion of master's thesis, a very special thank you for your practical and emotional support

ABSTRACT

Research in the area of data integration has resulted in approaches such as federated and multi-databases, mediation, data warehousing, global information systems, and the model management/schema matching approach. This thesis describes an approach for mediation of heterogeneous databases and follows this .approach for data integration

Syntactic structure is an important feature of natural language utterances, for both form and content. Therefore, applications of this thesis benefit from the integration of syntax into their schema .integration models of database

The idea of this thesis is to develop a new model for integrating heterogeneous databases using the XML features and parsing algorithms which use database commands instead of literal strings

A new XML-based model is presented in the thesis, along with a parsing algorithm: recursive descent parser of sentence structure, that is modify to acceptable relational database statement to use .XML as the internal data model for schema integration

To build this model, thesis uses recursive descent parser algorithm which uses the method Top-Down to analyze statement databases and modify the [Extended](#) and [Augmented](#) Backus–Naur Forms (EBNF) .grammar to become suitable to relational databases statements

المستخلص

توجد عدد من الطرق المتبعة لدمج البيانات وتكاملها ومن هذه الطرق قواعد البيانات الاتحادية والمتعددة، مفهوم الوسيط، تخزين البيانات، أنظمة المعلومات العامة بالإضافة إلى نموذج إدارة- وهيكلية طريقة المطابقة. في هذا البحث يتم استخدام طريقة الوسيط لدمج البيانات.

التركيب النحوي هو عنصر هام من عناصر النطق للغة الطبيعية من حيث الشكل والمحتوى. لذا كان التطبيق في هذا البحث يستفيد من التكامل في بناء الجملة في تكامل هياكل قواعد البيانات.

تقوم فكرة البحث على تطوير نموذج جديد لعملية دمج البيانات غير المتجانسة في قواعد البيانات العلائقية باستخدام مميزات الـ XML وخوارزميات المعرب اللغوي حيث يتم التعامل مع الأوامر الخاصة بقواعد البيانات بدلاً من السلاسل الحرفية.

في هذا البحث تم طرح نموذج جديد يعتمد على الـ XML وخوارزميات المعرب وهي معرب الهبوط اللغوي التكراري لتركيب الجملة، والذي عُدل لكي يصبح متوافقاً مع عبارات قواعد البيانات لاستخدام الـ XML كنموذج داخلي لعملية تكامل الهياكل.

لبناء هذا النموذج تم استخدام خوارزمية معرب الهبوط اللغوي التكراري حيث تم استخدام طريقة تحليل عبارات قواعد البيانات من أعلى إلى الأسفل وتعديل قواعد ([Augmented](#) Backus-Naur Forms) and ([Extended](#) EBNF)) النحوية للتناسب مع عبارات قواعد البيانات.
