

Declaration

I certify that this work has not been accepted in substance for any degree, and is not concurrently submitted for any degree other than that of Doctor of Philosophy (PhD) of the Sudan University of Science and Technology. I also declare that this work is the result of my own investigation except where otherwise stated.

Mohamed Elgamri Atta Elmanan (PhD Candidate) -----

Hassan Abdol Rahman Musnad (Supervisor) -----

Acknowledgments

This work would not be possible without the help and support of many people and institutions.

I would like to thank my supervisor Prof. Hassan A. Musnad for his continuous help and scientific advises.

I would also like to thank the dean of the College of Forestry and Range Science, Sudan University, Dr. Abdel Hafeez A. M. Yeddi for his support and help during the study.

My thanks and gratitude goes also to Secretary of Scientific affairs and the College of Graduate Studies of the Sudan University of Science and Technology for their support and flexibility.

My thanks and appreciations to IFS for their great support and make available all the necessary equipments and financing the field trips.

My thanks and appreciations go to my colleagues Dr. Abdelaziz Karamala and Dr Mohamed A. Dosogi for their continuous encouragement and scientific advice.

Thanks to Dr. Amnah Hamid head of remote sensing authority and Dr. Al Tayiab Ganawa for providing me with training in GIS and remote sensing.

My thanks to Siddig Elbushra and his colleagues in the training unit of the Ministry of Higher Education and Scientific Research for their help during preparation to travel to USA.

My gratitude to Anwar Abdol Hamid, the director of Forests National Corporation in the White Nile state and to Abdel Aziz Sid Ahmed the director of Ed Diuem Forests Circle for their support and hospitality.

My thanks and gratitude to the team helped to collect the field data, in particular Albalah, Abotalib, Hamid and Hassan Altom.

For their help and encouragement my thanks and appreciations go to the dear colleagues of Soba Dr. Tagelsir Elnaim, Dr. Ali Khalid, Dr. Ahmed Eldouma, Dr. Farah Yousif, Dr. Mohamed Osman Ibenof, Dr. Ibrahim Albaher Dr. Abdol Elhay Elmadina, Dr. Majeeda Ibrahim, Dr. Siddig Faris, Dr. Abdallah Elfeel, Dr. Nawal Khider, Dr. Amani Kobail, Dr. Yassir Yousif, Ustaz Abdolbasit Elhessain and Ustaz Mahgoup Sulieman.

My acknowledgement go to Germany to Prof, Johann Goldammer chair of the Global Fire Monitoring Centre and Mr. Gerd Wuesteney the former GTZ team leader at Jebel Marra Forest Circle for their support and encouragement.

Special acknowledgement to Prof. Chris Justice, the head of the geography Department at University of Maryland for his scientific advices, flexibility, support and encouragement.

Also in USA my gratitude and appreciations to Dr. Simon Trigg who was closely supervise my work in the University of Maryland.

My thanks and gratitude goes to Virginia for her first initiative to contact me from USA and also for her help and scientific advices.

My thanks and appreciations go to START organization for their financial support to accomplish my research work in USA.

My gratitude and appreciations go to Mohamed Ezeldeen Mirghani, Mohamed Yousif Lutfi, Mohamed Ahmed Yagoab and Elsadig for their help and hospitality during my stay in USA.

My gratitude is to wife Nadia Yousif For her patience and taking care of our kids.

Abstract

Although wildland fire occurs on a large scale in Sudan, there is limited knowledge on its extent, seasonality and frequency. Consequently its impacts on the environment are not well understood. The overarching objective of this study is to contribute in finding and recommending measures leading to minimize the adverse impacts of wildland fire on the environment in Sudan. This objective is investigated in the Albaja region of Sudan, which is chosen as a demonstration area representative of Sudan's marginal grassland. To address the objective in Albaja, the study integrates both biophysical and social survey data collected in the field with remote sensing data from the MODIS (MODerate Resolution Imaging Spectroradiometer) sensor. MODIS remote sensing data is analysed for the 2000-2005 period to discover Albaja's fire regime (extent, seasonality and frequency of burn). This new, satellite-derived information on burning in Albaja is then used to assess the effectiveness of the local fire management system that is currently applied to control wildland fires. The impacts of wildland fire frequency on trees, shrubs and grasses is then investigated by analyzing the satellite-derived fire data in conjunction with data collected in a vegetation cover survey carried out in Albaja in 2005. The study also combines MODIS vegetation index data with field measurements of herbaceous biomass in order to produce a spatially explicit map of end-of-wet-season biomass across the study area. Finally, a questionnaire survey with local farmers and nomads is used to investigate the different causes of wildland fire. The investigation reveals that on average 40% of the Albaja study area burns every year. It also reveals that the currently applied fire management activities do not control wildland fires and makes

recommendations to make these activities more effective. The study also concludes that the repeated wildland fires are negatively affecting the existence of the most valuable trees, shrubs and grasses, which subsequently reduces the range carrying capacity of Albaja and hence increase the poverty of the local people and the nomads. The study also finds that the spatial configuration and quantity of biomass become predictable at the end of the wet season by correlating field measurement of aboveground dry biomass with time-integrated vegetation index values obtained from MODIS vegetation indices product. Field-calibrated remote sensing data therefore provides a new, practical basis to prioritize the construction of fire lines to begin in areas with high biomass that are at most risk of fire spreading out of control. The social survey finds that the main causes of fire are Careless cooking, Charcoal production and Poachers. The combined results highlight the importance of fire as a process that affects not only the biophysical environment but also exerts direct control on people's livelihoods.
