

Dedication

I'm thanking:

- " God
- " My grandparents and extended family
- " My supervisor who coached me through
this Research and helped along the way
- " Friends who helped
- " The several specific people here who have
given advice

Acknowledgement

Deepest appreciation and sincerest gratitude and heartily thankfulness to the advisor and supervisor **Dr. Abdel Rasoul Jabar Alzubaidi** for his encouragement, advice and support during this Research of the PhD, who gave the moral support and guidance in different matters regarding the topic and helped a lot in gathering different information, collecting data and guiding from time to time in making this Research .Despite his busy schedules ,he had been very kind while suggesting the outlines of this Research and continuous guidance. I also wish to thank all those who helped. Without them, I could not have completed this Research. Very thankful to everyone who supported, in completing this Research effectively in time.

Lastly, I offer regards and blessings to all those who supported in any respect during the completion of the Research. Last but not the least; thank to all family

مستخلص

ان التقدم الحديث في مجال الاتصالات اللاسلكية زاد من كمية المعلومات التي يتم معالجتها في وقت محدد بواسطة الشبكات اللاسلكية وان الاعتماد علي استخدام القنوات اللاسلكية زاد استخدامه , وكذلك انتشار اشارته التلفون المحمول خلال القنوات اللاسلكية تشكل ظواهر متعددة التعقد مثل ظاهره الخفوت. و ان العمليات الرياضيه الدقيقه تحول هذه الظاهره من معقده الي قابله للتحليل والتعلم في مجال الاتصالات . وهناك مجهودات كثيره بذلت في النمذجه الاحصائيه وكانت نتيجتها الحصول علي طريقه احصائيه منضبطه للنمذجه في الخفوت التي تعتمد علي الانتشار في البيئه ولكن في نفس الوقت هنالك تحديات واجهت الاتصالات اللاسلكية وهي الحوجه الي معدل معلومات عاليه ونوعيه جوده الخدمة وقابليه الحركة و التنقل والربط في الشبكات اللاسلكية ومشكله التداخل بين المتحدثين مع بعضهم البعض و الخفوت و سرية وحفظ المعلومات. في هذا البحث سوف نري كيف نحسب ونضع حدا متوسطا ليتم حل مشكلة خفوت إشارة الصوت في الموبايل المحمول. و المعروف ان الخفوت يحدث لعدة اسباب منها :-

1-الانعكاس:-نتيجة لارتطام الموجة مع جسم مثال سطح الارض- البنايات - الحيطان

2-الحيود:-نتيجة لتعرض الاشارة المرسله او المستقبله مع سطح ذو شفة حادة مثل انحناء الموجات

حول العوائق

3-التشتت:- يحدث للموجات الكهرومغناطيسية عندما تسقط علي اجسام لها ابعاد متساوية او اكبر من

طولها الموجي – مثال اوراق الشجر- اشارات الشوارع –انوار الاعمدة

4-وسرعه الموبايل

ولحساب مشكلة الخفوت نستخدم عمليات رياضية ونماذج مختلفة مبينه في الاطروحه وان من فضل تلك الوسيله هي الحصول علي الجوده اللازمه في الشبكه وزياده متوسط دخل المستخدم . وتلك هي اهم الخصائص في التعاقد مع الشبكات . وأن التحدي الاكبر الرئيس هو الخفوت والتنقل الذان يوجد ترابط بينهما في الجوده وان طريقه بناء الشبكه للموبايل يعتمد علي عوامل عده اهمها التضاريسالخ و بالتعامل مع هذه القيم يمكن أن تغطي المناطق الفقيره (خارج المدى) بدون تركيب ابراجالخ

ان الهدف الرئيس لهذا المشروع هو التعرف علي خصائص التقسيم التشفيري لتعدد الوصوليه واكتشاف اساسياته لدراسه معاملات الخفوت للقنوات واكتشاف الطبقات الفيزيائيه التي يمكن ان تستخدمها بصوره فعاله

ومساهمة هذا البحث هو انه يلخص انواع مسببات الخفوت مثل ظاهرة دبلر وتأخير الانتشار.....الخ ثم عمل علي محاكات وتحليل للنائج. والنتيجه المحصله يمكن ان تستخدم في تصميم شبكات اي اختيار نتائج عمليه مناسبه مع تضاريس السودان ويمكن التحقيق من جوده الموبايل في الاتصالات والتكيف مع التعديل في قنوات الخفوت واضعا في الاعتبار تحسين مختلف استخدامات الموبايل.

Abstract

Recent advances in wireless communication systems have increased the throughput over wireless channels and networks, at the same time; the reliability of wireless communication has been increased. A mobile signal propagation through wireless channel is a complicated phenomenon characterized by such problem as fading .A precise mathematical, description of this phenomenon is either unknown or too complex for tractable communication system analyses, however considerable efforts have been devoted to the statistical modeling and characterization of the different effects ,the result is a range of relatively simple and accurate statistical models of fading channels that depends on particular environmental propagation

Some of the challenges in wireless communications are:-

A need for high data rates, quality of service, mobility , portability, connectivity in wireless networks, interference from other users , (Fade),privacy/Security.

This research shows how to calculate and put suitable parameters to solve the fade out of fading of the signals in mobile station, .Fading, is caused by:-

1- Reflection. – Propagating wave impinges on an object which is large compared to the wavelength– e.g., the surface of the Earth, buildings, walls, etc.

2- Diffraction. – Radio path between transmitter and receiver obstructed by surface with sharp irregular edges– Waves bend around the obstacle, even when the line of the site does not exist.

3- Scattering. – Objects smaller than the wavelength of the propagating wave– e.g., foliage, street signs, lamp posts.

4-The Speed of the mobile handset

This Research aims to calculate and measure the fading uses of different statistical and model in this Research, allows for the graceful introduction of newer applications, thereby increasing the average revenue per user, in contract of network, Quality of Services provisioning in mobile network is more challenging primarily due to the fading and mobility which are most in corporate in the quality of services architectures designed for mobile network depend on the terrain, dealing with these parameters can cover the poor areas (out of range) without installing BTS.....etc.

The primary goal of this research work is to identify the basic characteristics of CDMA, explore fundamental concepts of the fading parameters of wireless channels and the physical layer .This can be consider as contribution which can effectively used. This research also summarizes the types of fading caused by Doppler spread and Delay spread.

Besides making simulation and analysis of results the concluded, the result can be used to design suitable network N.W to Sudan terrain, and make certain of the mobile quality on the communication range and adapted modulation with the fading channels, considering the improvement of the multi-user of mobile.

Table of Contents

	Page
Dedication	i
Acknowledgment	ii
مستخلص	iii
Abstract	v
Content	vii
List of Figure	xii
List of Table	xv
Abbreviations	xvi

Chapter One

1-Introduction	1
1-1-Preface	1
1-2-Problem Statement.....	2
1-3-Objective.....	3
1-4-Methodology.....	4
1-5- Research Plan.....	5

Chapter Two

2-Background in Telecommunications	8
2-1-Traffic Measurement: Traffic Intensity.....	9

2-1-1-Traffic Concepts.....	10
2-2-Busy Hours.....	11
2-3-Holding Time.....	12
2-4-Grade of Service.....	13
2-4-1GoS, Loss System.....	13
2-4-2-GoS, Delay System.....	14
2-5-Fading.....	15

Chapter Three

3- Multiple Access Technology.....19

3-1- CDMA	22
3-2- CDMA Concept.....	23
3-3- CDMA Features and Advantage.....	24
3-4-Handover.....	25
3-5-Spread Spectrum.....	27
3-5-1- Direct-Sequence Spread Spectrum (DSSS)	28
3-5-2-Frequency Hopping Spread Spectrum (FHSS).....	31
3-5-3-RAKE Receiver.....	33

Chapter Four

4- Models 35

4-1-The Log-Distance Path Loss Model	35
4-2-Out Door Propagation Model.....	36
4-3- Indoor Propagation Model.....	36
4-4-Simulation of Fading.....	38
4-4-1- Coding for the Simulation Introduction	40

4-4-2-Coding Program of Experiment One.....	44
4-4-3- Coding Program of Experiment Two.....	47
4-4-4-Coding Program of Experiment Three.....	51
4-5- Fade Margin Calculator.....	55
4-6-Calculate Distance.....	56
4-7-Calculate Fresnel Zone Radius.....	56
4-8- Find Suitable Antenna.....	57
4-9-Matlab of Rayleigh	59

Chapter Five

5- Radio Wave Propagation Deterministic

Models	65
5-1- Overview.....	65
5-2- Free Space Propagation Model	67
5-3- Basic Propagations Mechanisms.....	69
5-3-1- Refraction	69
