

DEDICATION

To all Sudanese children with great love.

ACKNOWLEDGEMENTS

I wish to express my deep sense of gratitude and sincere thanks to my supervisor Dr. Mohamed Abdel Rahim A/Alla for help guidance, criticism advice and supervision throughout the course of this study and preparation of the thesis.

My thanks and gratitude are also extended to Dr. Abdel Wahab H.Abdalla for his great help and the statistical analysis of the data.

Thanks are also extended to Dr. Fatima Ismail and Dr. Haidar Mohamed Abdel Rahim for their help in serum electrophoresis the analysis of protein electrically.

My special thanks to technicians of Khartoum Children's Emergency Hospital and to technicians of National Health Laboratory. Sincere appreciation is extended to Mr. Hashim Awad Elkarim for his help and continuous support.

Finally, I would like to express my sincere and thanks to my husband and my parents, for their constant support and encouragement.

DECLARATION

The work prescribed in this thesis has been conducted by the undersigned in the department of biochemistry in the National Health Laboratory, and Laboratory C15 for children in Khartoum Children's Emergency Hospital.

Hereby I declare that:

- I did all blood collection and plasma separation.
- I performed all clinical investigations.

I also declared that this topic had not been submitted to any other University or research centre before for any other degree.

Signature (supervisor).....

Abstract

60 children were admitted to Khartoum and Omdurman Children's Emergency Hospitals. Measurement biochemical and haematological parameters were determined in (20) control, children suffering from diseases except protein energy malnutrition under five years during the period April-August 2001.

Measurements were determined in (23) with marasmus, (5) with Kwashiorkor, (12) with marasmic Kwashiorkor syndrome and 20 control.

On admission, Haemoglobin (Hb%), iron (Fe), total protein, albumin, body weight, protein electrophoresis, Erythrocyte Sedimentation Rate (ESR), mean cell haemoglobin (MCH), Mean Cell Haemoglobin Concentration (MCHC), Packed Cell Volume (PCV), Red Blood Cell Counts (RBCs), Total White Blood Cell Counts (TWBCs) and Mean Cell Volume (MCV) serum were measured also age, mother's education and father's income were known in controls and children suffering from Kwashiorkor, Marasmus and marasmic Kwashiorkor.

Measurements obtained in this study revealed that Hb%, Fe, T_p, Albumin, Hgb %, PCV, RBCs, MCHC, MCH and body weight were significantly lower than the levels of the control children in the three studied groups of protein energy malnutrition (PEM).

There is evidence that malnourished children are at greater risk for malnutritional and related health problems than the healthy children (control). All malnourished children were under weight compared with the well-nourished children.

Socially, it was found that poverty, illiteracy and unhygienic conditions contributed to the multi-factorial disease of malnutrition.

الخلاصة

توجه البحث الى دراسة الجوانب الكيمياء حيوية ومكونات الدم فى مصل دم الأطفال الذين يعانون من سوء التغذية بأنواعه المختلفة (سفل، كواشيوركور، كواشيوركور، سفلي) اشتملت الدراسة علي (40) كان (23) منهم يعانون من سفل و (5) يعانون من كواشيوركور و(12) يعانون من كواشيوركور - سفلي، أدخل الأطفال مستشفى حوادث الخرطوم للأطفال ومستشفى حوادث أمد رمان للأطفال، كل الأطفال الذين يعانون من سوء التغذية أعمارهم أقل من خمس سنوات. أيضا تمت دراسة (20) طفلاً طبيعيين من ناحية القياسات البشرية (Anthropometry) دون الخامسة من العمر، تمت الدراسة في الفترة ما بين أبريل 2001- أغسطس 2001. توجه البحث لقياس تركيز الهيموقلوبين (%Hb)، حجم الخلايا المترسبة (PCV)، معدل ترسيب الخلايا الحمراء (ESR)، حساب البروتين (TP)، الألبومين (Albu)، الحديد (Fe)، الوزن (Wt)، متوسط حجم الخلايا (MCV)، متوسط مستوي تركيز الهيموقلوبين فى الخلايا (MCHC)، وحساب كريات الدم الحمراء والبيضاء، تحليل البروتين كهربائياً (Protein Electrophoresis) بالإضافة لمعرفة العمر ومستوي تعليم الأمهات ودخل الأب نسبة لأهميتها فى التأثير علي تغذية الطفل ولقد تمت معرفة مستوي هذه المواد عند كل الأطفال وقد لوحظ أن النتائج التي تحصل عليها من هذا البحث يظهر انخفاضاً في مستوي تركيز الهيموقلوبين، الحديد، الوزن، عدد كريات الدم الحمراء، البروتين، متوسط حجم الخلايا المترسبة، متوسط تركيز الهيموقلوبين فى الخلايا، متوسط الهيموقلوبين فى الخلايا والألبومين فى الثلاث مجموعات المدروسة التي تعاني من نقص البروتين ومواد الطاقة عند هؤلاء الأطفال.

أكدت الدراسة أن الأطفال الذين يعانون من سوء التغذية هم أكثر عرضة من غيرهم من الأصحاء للإصابة بالأمراض ذات الصلة بسوء التغذية. وأن الأطفال الذين يعانون من سوء التغذية أوزانهم ناقصة بغيرهم من الأطفال الأصحاء.

أما بالنسبة للحالة الاجتماعية فقد أظهرت النتائج أن الفقر والجهل والبيئة غير الصحية التي يعيش فيها الأطفال تؤدي إلى الإصابة بسوء التغذية.
