

## **Abstract**

The study aimed at investigating the level of aggressive behavior of Sudanese football player with reference to the Sudanese league and its relation to self concept and other variable .The researcher adopted the descriptive analytical method of research for it suits the topic and the objectives of the study, the community of the research are 392 football players in the Sudanese League where the sample was a stratified random one which consisted of 122 players representing 30% of the total number of players in the Sudanese League . The research used the Scale of aggressive behavior designed by Mohammed Elhassan Alawi and Tennessee Seelf Concept – the researcher adapted them to the Sudanese environment .The most important results are :

1. The is aggressive behavior of the players in the Sudanese League of an average degree
2. Self concept of the footballers in the Sudanese League is high .
3. There is a statistically significant relation between the self concept and the variable of academic qualification . The higher the academic qualification is ,the higher the self concept becomes .

The study recommends that concern should be given to the psychological considerations concerning the football players in Sudan, it also recommends that concern should be given to the psychological preparation of the players and the employment of specialists in psychiatry to be with Sudanese football teams .
