FFPE	Formalin Fixed Paraffin Embedded

ACKNOWLEDGEMENTS

Above all, praise is to my almighty Allah for giving me a good health, wisdom, ability, and strength to carry out this work and for all other graces.

I would like to express my deep and sincere gratitude and appreciation to my supervisors Professor. Abd-Alhamid A. M. El-Fadil, Sudan College of Veterinary Medicine, Sudan University of Science and Technology, Sudan; Doctor. Sobhi Ahmed Mohammed Khair Soba Veterinary Research Institute , for their excellent guidance, support, and constant encouragement throughout this project and also for their invaluable assistance and instructions, without which, it would not have been possible to accomplish this project and for reading and correcting the manuscript.

I am also indebted to Dr. Egbal Sid Ahmed Abdelrahim, Department of poultry, Soba Veterinary Research Institute, for her kind assistance and guidance and would like to thank them very much. I would also like to thank the people of the Department of poultry, Soba Veterinary Research Institute for their endless and kind help during carrying out the ELISA test.

I would like to thank Professor. Mohammed Tageldeen, for his significant assistance during the workshop of the statistical analysis.

I am grateful to the Unit of Field Investigation, Directorate of Animal Health and Epizootic Diseases Control (DAH and ED), Ministry of Animal Resources and Fisheries (MARF), Khartoum, Sudan, and to Soba Veterinary

Research Institute (SVRI), Khartoum, Sudan, for their kind help during sampling and field missions. I am also grateful to Dr. Leila Mohamed Ibrahim in the Unit of Statistics and Geographical Information System (GIS), Directorate of Animal Health and Epizootic Diseases Control, Ministry of Animal Resources and Fisheries for providing the Chloropleth maps.

I would like to thank Dr. Ismail Adam Yagoub, Ministry of Animal Resources and Fisheries (MARF), for his very useful assistance.

I offer my sincere gratitude also to Dr. Hisham Ismail Seri, College of Veterinary Medicine, Sudan University of Science and Technology and Dr. Abd-elraheem Suleiman, Food and Agriculture Organization of the United Nations (FAO), for their very useful assistance.

I am really grateful to, Professor. Mohamed Abd-Alsalam Abdalla the dean of CVM, SUST, Dr. Khidir Mohamed Al-Faky Directorate of Animal Health and Epizootic Diseases Control (DAH and ED), Ministry of Animal Resources and Fisheries (MARF), Dr. Al-Fatih Ahmed Abd Alrahman, for their kind cooperation and support. I am thankful to all my colleagues and farms owners and herders for answering the questionnaires and also thankful to all people who helped me in way or another to accomplish this work.

Many thanks to my class mates in Master Program in university of Sudan for their everlasting cooperation and encouragement.

Finally, I am thankful to my father, my uncle Professor. Adam Dawoud, my beloved sisters and brother, Dr. Yassir Adam Shuaib and to all my friends for their everlasting support.

ABSTRACT

This study aimed to determine the prevalence and risk factor and to assess the occurrence of chicken anaemia virus (CAV) in Khartoum state, Sudan. A total of 450 serum samples were collected randomly from commercial chickens' farms in different areas in Khartoum State (210 layers and 240 broilers). The samples were tested by indirect ELISA commercial kit. Out of 210 serum samples 201 from layers, were found positive for chicken anaemia virus (95.7%). In broiler flocks, 129 were found positive and the prevalence rate was 53.8%. The estimated overall sero-prevalence rate of CAV was found to be 73.3%. In the univariate analysis using the Chi square test for risk factors, governorate and locality, (type of production, poultry population, husbandry system, body condition, source of poultry, floor type, vaccination, breeds and age), ($p\text{-value} \leq 0.05$), were found to be significant risk factors. The risk factors found to be significantly associated with increased odds of being ELISA positive in the multivariate analysis were governorate, type of production, poultry population, husbandry system, source of poultry and vaccination ($p\text{-value} \leq 0.05$) were significant risk factors. While the factors found not significantly associated with increased odds of being ELISA positive were, ages, floor type and poultry population ($p\text{-value} > 0.05$). Investigation results suggest that CAVD has wide spread in Khartoum State. In conclusion, the disease is highly prevalent in Khartoum State, Sudan. Urgent need therefore exists to initiate a realistic network for surveillance, control and eradication of this important viral poultry disease in the Sudan.

Keywords: Sudan, chicken, CAV, sero-prevalence, risk factors

ملخص البحث

هدفت هذه الدراسة لتحديد معدل إنتشار فيروس مرض انيميا الدجاج وعوامل الخطر في ولاية الخرطوم بالسودان. تم جمع ٤٥٠ عينة مصل من مزارع الدواجن في مناطق مختلفة من ولاية الخرطوم. (٢١٠ عينة مصل من الدجاج البياض و ٢٤٠ عينة مصل من الدجاج اللاحم). تم إستخدام تقنية المقايسة المناعية الغير المباشرة المرتبطة بالانظيم . من ٢١٠ عينة مصل من الدجاج البياض ٢٠١ عينة مصل كانت موجبة بنسبة (٩٥.٧٪)، ام في الدجاج اللاحم ١٢٩ عينة مصل من جملة ٢٤٠ عينة مصل وجدت موجبة بنسبة (٥٣.٨٪). من المجموع الكلى للامصال ٣٣٠ عينة مصل بنسبة (٧٣.٣٪) وهو عبارة عن نسبة إنتشار اضرار داء فيروس انيميا الدجاج في مختلف الاعمار من عمر يوم وحتى عمر ٥٤٠ يوم .

التحليل الاولى بإستخدام مربع كاي لعوامل الخطر (المجالس، المحليات ، نوع الانتاج، عدد القطيع، نظام التربية، المظهر العام للقطيع، مصدر الدواجن، نوع الارضية، التطعيم، السلالة والعمر) اوضح ان هذه العوامل ذات علاقة معنوية بإنتشار المرض ($P\text{-value} \leq 0.05$). اما في التحليل المتعدد اوضح ان كل عوامل الخطر ذات علاقة معنوية بإنتشار المرض ($P\text{-value} \leq 0.05$) عدا العمر، نوع الارضية والحالة العامة للقطيع ليست لهم علاقة بالمرض ($P\text{-value} > 0.05$). اكدت النتائج ان المرض واسع الانتشار في ولاية الخرطوم لذا يجب الإهتمام ببرنامج التقصى الحقلى، المسح والسيطرة على المرض فى السودان .
