Abstract

Electrostatic actuators have major role in many MEMS devices, e.g. sensors, actuators. The amount of applied voltage to an electrostatic actuator has a direct impact on frequency throughout the actuator. This research aims to study the compensating frequency by using pressure equivalent to the value of the direct voltage through Electrostatic actuator in a micro-cantilever. Finite element method, ANSYS, was used as a simulation tool.

المستخلص

للمحرك الإلكتروني دوراً هاماً في كثير من الأنظمة الكهربائية الميكانيكية متناهية الصغر على سبيل المثال الحساسات والمحركات. لمقدار فرق الجهد المسلط على المحرك تأثير مباشر على التردد خلال المحرك. هذا البحث يهدف لدراسة ضبطية التردد عن طريق استخدام الضغط المعادل لقيمة فرق الجهد المباشر خلال محرك إلكتروني (على شكل كابولي) مصغر. تم استخدام طرق التحليل المحدود للعناصر ممثله في برنامج انسيس كوسيلة للمحاكاة.

1.1. Introduction:

Electro statically actuated cantilever beam is a base component in low frequency MEMS filters. The cantilevers are used in electrical sensors. The purpose of research is compensating frequency change using DC voltage on electrostatic actuator by applying MEMS technology and simulating by ANSYS program.

1.2. Research Problem:

When production actuators are set to a specific frequency with adding AC voltage, In some cases, for reasons manufacturing occurring difference in the values of frequencies actuators. In order to change the frequency we have to change the actuator. Instead of changing the actuator can change the frequency and control its value by DC voltage.

1.3. Objective:

This research aimed to study:-

1. The effect DC voltage to frequency value.

1.4. Methodology:

NO	ASSIGNMENTS	Duration in weeks	DATE from__to
1	Studying ANSYS course	3	2013/11/28—16
2	The model design	2	2013/12/21—8
3	Mid term exams	5	2014/1/15—22
