

الآية

قال الله تعالى:

(اللهُ لَا إِلَهَ إِلَّا هُوَ الْحَيُّ الْقَيُّومُ لَا تَأْخُذُهُ سِنَّةٌ وَلَا نَوْمٌ لَهُ مَا فِي السَّمَاوَاتِ

وَمَا فِي الْأَرْضِ مَنْ ذَا الَّذِي يَشْفَعُ عِنْدَهُ إِلَّا بِإِذْنِهِ يَعْلَمُ مَا بَيْنَ أَيْدِيهِمْ وَمَا خَلْفَهُمْ وَلَا يُحِيطُونَ بِشَيْءٍ مِّنْ عِلْمِهِ إِلَّا بِمَا شَاءَ وَسِعَ كُرْسِيُّهُ السَّمَاوَاتِ

وَالْأَرْضَ وَلَا يَئُودُهُ حِفْظُهُمَا وَهُوَ الْعَلِيُّ الْعَظِيمُ)

صدق الله العظيم

سورة البقرة الآية 255

OUR TEACHERS

Acknowledgment:

Praise be and thanks first and foremost to Allah alone, and we praise and thank Him for His outward and inward the grace and a thousand prayers and peace upon Syed all human beings the prophet Mohammed peace be upon him.

A lot of thanks to anyone who helped us to finish this work.

And Special thanks to **DR. MOHAMMED ELFADHIL.**

Abstract

This research discusses the parameters that affected the optimization of exposure factors of lumbosacral region. This research found that most important parameter is weight and it is a significant one and can affected in to selection of exposure factors of lumbosacral region regardless if the patients male or female and the selection of exposure factors of AP and Lateral lumbosacral region don't influence by patients age and length. This research found a number of equations that can be give the patients the appropriate dose for imaging of lumbosacral region instead of guessing according to consideration of the patient or using of the exposure chart.

This equations proportion only with the weight, according to it can select the optimize exposure factors for lumbosacral region. The study consisted of 40 patients, their mean age, height; weight was **39.2±13.8**, **166±7.9**, **67.2±14.3** respectively. While the average exposure factors for AP concerning the **KV** and **mAs** was **80.5±10.3**, **36.9±10.3** respectively. and the average exposure factor for lateral projection concern **KV** and **mAs** was **87.4±5.1** , **44.1±7**.

الملخص

يناقش هذا البحث أمثلة عوامل التصوير للمنطقة القطنية العجوية . ووجدت هذه الدراسة ان أكثر العوامل أهمية هو الوزن ، ويمكن ان تنفذ بإختيار عوامل تعويض المنطقة القطنية العجوية بغض النظر اذا كان المريض زكراً أو أنثى ، وإختيار عوامل التعويض الأمامي الخلفي والجانبى للمنطقة القطنية العجوية لا يتأثر من قبل طول وعمر المريض . ووجد هذا البحث عدد من المعادلات التي يمكن ان تكون عن طريقها اعطاء المرضي جرعه مناسبة لتصوير المنطقة القطنية العجوية بدلاً من التخمين وفقاً للنظر للمريض او عن استخدام جولة عوامل التعويض . هذه المعادلات تتناسب فقط مع الوزن وفقاً لذلك يمكن تحديد عوامل التعويض الأمثل للمنطقة القطنية العجوية .

هذه الدراسة مكونه من أربعين مريضاً وتعتمد هذه الدراسة علي العمر و الطول والوزن . ووسطها الحسابي بثلث تيب:

$$39.2 \pm 13.8, 166 \pm 7.9, 67.2 \pm 14.3$$

بينما متوسط عوامل التعويض (كيلوفولت و مل امبير) في الفحص الامامي الخلفي للمنطقة القطنية العجوية كانت بثلث تيب:

$$80.5 \pm 10.3, 36.9 \pm 10.3$$

بينما متوسط عوامل التعويض (كيلوفولت و ملي امبير) في الفحص الجانبى للمنطقة القطنية العجوية كانت بثلث تيب:

$$87.4 \pm 5.1, 44.1 \pm 7$$

Abbreviation:

Abbreviation	Meaning
L/S	Lumbosacral
SSD	Source surface distance
Kvp	Kilovoltage peak
mA	Milliamper
AEC	Automatic exposure control
CT	Computer tomography
MRI	Magnetic resonance imaging
FGP	Fluoroscopy guiding positioning
Fig	Figure
Lat	Lateral
AP	Antroposter
