

Abstract

The research addresses Banking Technology (BT) in Sudan as a newly implemented project. The research is based on different hypotheses , the first one is that there is a technical gap in the banking system in Sudan. The second hypothesis is that there is technical awareness of some of the banks' staff. Thirdly the practical application of BT in Sudan is not campanile with the inter nation of standards. The four in hypotheses is that the culture of the user to BT is weak. To last the hypotheses descriptive methods stateside Analyse were adopted in a case study. The study accepted all the hypotheses according the full accommodation. And usage of the BT infrastructure at also recommended for adoptier of minified standards to cope with the development of BT.
