

DEDICATION

To my mother

My first teacher

To my father

My hero

To my husband

MY other hero

To my brothers , sisters and friends

To all those un believable persons

I am trying to say thank you

ACKNOWLEDGMENT

First of all I great thank go to Allah

I thank my supervisor Dr Moneira Abd Allah

For she is expert supervision , guidance motivation

and support throughout the course of this work .

Finally I must thank all my colleagues in the

Department of histopathology and Cytology

ABSTRACT

This study carried out in Khartoum state during the period February 2012- September 2012. The study aimed to detect the expression of carcino embryonic antigen (CEA) tumor marker in colorectal carcinomas and its association with cytokeratins 20 (CK20) using immunohistochemistry technique.

Fifty formalin-fixed paraffin embedded tissues that were previously diagnosed as colon cancer with different histological types classified as non mucin secreting which the highest one that constituted 43(86%), followed by mucin secreting carcinoma 4(8%) ,2(4%) tubular carcinoma and 1(2%) lymphoma, most cases were classified according to tumor grades as moderately differentiated tumor.

The age of study group range between (30- 80) years and majority of cases within age grouping 41-50 years and 51-60 years constituted 16(32%) cases for each.

Males were affected more than females constituting 28(56%) and 22(44%) respectively.

Forty one (82%) of cases were positive for CEA tumor marker.

Out of 47(94%) positive for CK20, 40(80%) were positive for CEA, while other 3(6%) cases that negative for CK20, 1(2%) was positive for CEA.

According to this findings the study conclude that CEA has high expression among colorectal carcinomas grades with significant correlation between CK20 and CEA expression .

خلاصة الأطروحة

أجريت هذه الدراسة في ولاية الخرطوم في الفترة من فبراير إلى سبتمبر 2012م .

هدفت الدراسة للكشف عن واسمه السرطان CEA في مرضي سرطان القولون وارتباطه مع CK20 باستخدام كيمياء مناعة الأنسجة .

خمسون نسيج مثبت بالفورملين مغمور بشمع البرافين وتم تشخيصه مسبقاً على أنه كسرطان قولون مع مختلف الأنواع صنف كالآتي :-

السرطان الغدي وكان اعلي واحد حيث يمثل (86%) 43 يليه السرطان ذو الإفراز المخاطي (8%) 4 ، والسرطان الأنبوبي (2%) 1 والسرطان الليمفاوي (4%) 2 .

ومعظم الحالات صنفت استناداً على حدة السرطان على أنها ورم متوسط التمييز .

وكانت أعمار المجموعة تحت الدراسة تتراوح بين 30-80 سنة ومعظم الحالات كانت في الفئات العمرية من 41-50 سنة و 51-60 سنة حيث تمثل (32%) 16 لكل واحدة .

معدل الإصابة عند الذكور اعلي منه عند الإناث (56%) 28 ، (44%) 22 على التوالي .

واحد وأربعون (82%) من الحالات كانت ايجابية بالواسمة الورمية CEA .

خارج (94%) 47 ايجابية لـ CK20 و (80%) 40 ايجابية لـ CEA . بينما الثلاثة (6%) حالات أخرى التي كانت سلبية لـ CK20 واحدة (2%) كانت ايجابية لـ CEA .

استناداً على هذه النتائج خلصت الدراسة إلى أن اعلي تعبير بالواسمة الورمية CEA في سرطان القولون ودرجاته مع وجود علاقة متخصصة بين واسمات الورم CK20 و CEA .
