

## **Dedication**

To my family who always support me all time,  
encourage and want me to be the best

To my teachers, friends whom always I find  
them beside me and support me in anything.

To any person who help me to complete this  
work

## **Acknowledgement**

Firstly , great thank to allah to let me reaching  
this agreat place .

and great thank to my supervisor DR/  
**Asmalbrahim** for her effort and support  
me to complete this work.

Also I want to thanks my colleagues in all  
CT center especially in Alamal diagnostic  
center and Sudan advanced center  
,Alzaytouna hospital for their help.

Very special thanks to my parent for their  
effort, patient with me to finish this work.

## **Abstract**

This study was carried out to evaluate and diagnosis renal arteries using multidetector computed tomography angiography for the donors.

The study was carried out in Alamal diagnostic centre and Alzaytouna hospital ,and Sudan advanced centre , where 50 patients were collected randomly from different ages and different genders 30 male , 20 female , this study has been carried out in 3-4 months.

The general objective of this study is the evaluation the role of multi-detector computed tomography angiography in diagnosis of renal vascular of the renal system in donors

The data of this study was collected by data collecting sheet and analysis using Microsoft Excel and software package for statistical analysis(SPSS).

All donors underwent to multidetector computed tomography angiography of renal, the study conclude that multidetector computed tomography angiography could evaluate renal arteries in 44 donors by 88 % of is normal and free from any anomalies, 4 donors 8% had double renal arteries in RT kidney and , 2 donors 4%

had Arteriovenous malformation , so that the multidetector computed tomography angiography succeeded to exclude 6 subjects from donation, donor with Arteriovenous malformation and the other had double renal arteries. images and decreased the time and radiation dose.

### ملخص البحث

اجريت هذه الدراسة لتقويم وتشخيص الشرايين الكلوية لمتبرعي الكلي باستخدام الاشعه المقطعية متعددة الكواشف .

حيث اجريت هذه الدراسة بمركز الامل التشخيصي , وايضا بمستشفى الزيتونه , و مركز السودان المتطور, حيث تم جمع 50 عينه عشوائيا من مختلف الاعمار والاجناس , و استغرقت الدراسة من 3-4. شهور

الهدف الرئيسي لهذه الدراسة هو تقييم دور الاشعة المقطعية في تشخيص اوعية الكلي الدمويه للمتبرعين .

و قد تم جمع بيانات هذه الدراسة بواسطة ورقه تجميع بيانات وقد تم تحليلها بواسطه برنامج مايكروسفت اكسل وبرنامج التحليل الاحصائي

حيث أخضع كل المتبرعين وعددهم 50 متبرع لفحص الشرايين الكلويه بواسطه الاشعه المقطعيه متعددة الكواشف . عليه توصلت الدراسة انه يمكن تقويم الشرايين الكلوية لمتبرعي الكلي بالأشعة المقطعيه متعددة الكواشف بنسبة 88% في 44 متبرع كانوا طبيعيين و 8 % في 4 متبرعين لديهم شريانين في الكله اليمني , و 2 متبرعين بنسبة 3 % لديه تشوة شرياني وريدي

. بهذ نجحت الأشعة المقطعية متعددة الكواشف من استبعاد 6 متبرعين من التبرع بالكلي لأن  
 .منهم من يعاني من تشوة شرياني وريدي والبعض الآخر لديهم شريانين في الكلي اليميني  
 أيضا استخدام الاشعه المقطعية متعددة الكواشف مكننا من الحصول علي صورة بجوده عالية  
 وايضا تقليل الزمن وتقليل الجرعه الاشعاعية

### Abbreviations

Abbreviations	Words
2D	2Dimension
3D	3 Dimension
ADH	Antidiuretic hormone
AVMs	Arteriovenous Malformations
CKD	Chronic kidney disease
