

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

قال تعالى:

(قُلْ لَوْ كَانَ الْبَحْرُ مَدَادًا لِكَلِمَاتِ رَبِّي لَنَفِدَ الْبَحْرُ قَبْلَ أَنْ تَنْفَدَ
كَلِمَاتُ رَبِّي وَكُوْجِنَّا يَمْثُلُهُ مَدَادًا)

صدق الله العظيم

سورة الكهف: الآية (109)

DEDICATION

To my parents

Brothers

Friends

Colleagues

ACKNOWLEDGMENTS

Firstly, thanks to ALMIGHTY ALLAHA for helping me to complete this study.

I would like to express my sincere thanks and gratitude to my supervisor Dr. Abdelbagi Elnagi Mohamed whose help, stimulating suggestions, knowledge, experience and encouragement helped me in all the times of study.

I am indebted to the members and staff of College of Medical Laboratory Science, SUST, for their help, cooperation and encouragement.

A special thanks to Ms. Suhair Ramadan for her vital encouragement, support, and valuable advices.

My appreciation to all members and staff of the laboratory at Omdurman Maternity Hospital for assisting in the collection of the samples.

I would like to acknowledge and extend my heart full gratitude to all subjects for their participation and cooperation.

Also, very special thanks to my colleagues for their unlimited support throughout this study.

I would like to say thank you to my beloved parents who have been the source of encouragement throughout my life and who teach me how to fulfill my dreams.

ABSTRACT

This study was conducted during the period from May to September 2012 to determine the seroprevalence of human cytomegalovirus (HCMV) among pregnant women at Omdurman Maternity Hospital.

A total of 130 subjects were included in this study. One hundred (n=100) subjects were pregnant women attending the antenatal clinics of Omdurman Maternity Hospital for antenatal care, the remaining thirty (n=30) women were apparently healthy, non-pregnant women with no history of blood transfusion or abortion included as control group. The ages of all women tested ranged from 17 to 42 years.

Personal and clinical data were collected by questionnaire after a verbal consent, serum samples were collected, tested for CMV IgG and IgM using enzyme-linked immunosorbent assay (ELISA).

Out of the 100 pregnant women tested, 97(97%) and 7(7.0%) were CMV IgG and CMV IgM positive, respectively. While in the 30 non-pregnant women of the control group, 28(93.3%) and 1(3.33%) were CMV IgG and CMV IgM positive, respectively. The age and history of abortion were significantly associated ($p < 0.05$) with CMV IgM seropositivity. While the parity, gestational age, congenital abnormalities, educational level and occupation were not significantly ($p > 0.05$) associated with CMV infection.

ملخص الاطروحة

اجريت هذه الدراسه لتحديد الانتشار المصلي لفيروس مضخم الخلايا وسط الحوامل بمستشفى التوليد بأم درمان. شملت الدراسه مائة وثلاثون امرأة (130). مائة منهان كن نساء حوامل اتبن لعيادات رعاية الحوامل بمستشفى الولادة بامدرمان للرعاية الطبية وباقى العدد ثلاثين (30) كن نساء سليمات ظاهرياً لم تجهضن من قبل ولم تجرين نقل دم سابق ادرجن في الدراسه كمجموعة ضابطة للاختبار. اعمار كل النساء الاتي اختبرن كانت تتراوح ما بين 17 الى 42 سنه.

تم جمع المعلومات الشخصية والطبية عن طريق الاستبيان بعد موافقتهن الشفوية ومن ثم اخذت العينات وفحست لمعرفة احتواها على اجسام مضادة من النمط IgG والنمط IgM لفيروس مضخم الخلايا باستخدام اختبار الاليزا.

من مجموع 100 من النساء الحوامل 97 منهان (97%) كانت لديهن اجسام مضاده من النمط IgG و 7 منهان (7%) كانت لديهن اجسام مضاده من النمط IgM، بينما فى مجموعة النساء الضابطات للاختبار غير الحوامل 28 منهان (93.3%) اعطين نتائج ايجابية للنمط IgG وواحدة منهان (3.33%) اعطت نتيجة ايجابية للنمط IgM لفيروس مضخم الخلايا.

كانت هنالك علاقه ذات دلالة احصائيه (القيمه الاحتماليه اقل من 0.05) بين كل من تاريخ الاجهاض وعمر النساء الحوامل من جهة ومعدل ايجابية الاجسام المضاده من النمط IgM لفيروس مضخم الخلايا من الجهة الاخرى.

وجد فى هذه الدراسه ان كل من عدد مرات الوضوح، عمر الحمل، المستوى التعليمي، وجود اطفال ذوى تشوهدات خلقيه والوظيفه ليست لها علاقه ذات دلالة احصائيه (القيمه الاحتماليه اكبر من 0.05) بالاصابه بفيروس مضخم الخلايا.
