

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

قَالَ اللَّهُ تَعَالَى

الَّهُ نُورُ السَّمَاوَاتِ وَالْأَرْضِ ۖ كَمِشْكَاةٍ فِيهَا مِصْبَاحٌ ۖ الْمِصْبَاحُ فِي نُرْجَاجَةٍ ۖ
النُّرْجَاجَةُ كَأَنَّهَا كَوْكَبٌ دُرْرِيٌّ يُوقَدُ مِنْ شَجَرَةٍ مَبَارَكَةٍ مِنْ مَوْيَةٍ لَا شَرْقَيَةٌ وَلَا غَرْبَيَةٌ
يَكَادُ مِنْهَا يُضِيءُ وَلَوْلَمْ تَمْسَسْهُ مَارِقٌ نُورٌ عَلَىٰ نُورٍ ۖ يَهْدِي اللَّهُ نُورٌ مَنْ يَشَاءُ ۖ
وَيَضْرِبُ اللَّهُ أَمْثَالَ النَّاسِ ۖ وَاللَّهُ كُلُّ شَيْءٍ عَلَيْهِ

صَدَقَ اللَّهُ الْعَظِيمُ

سورة النور الآية (35)

Dedication

To my father

My mother

My brother

My friend (wifaq ,usra, Sara and Abubakr)

Acknowledgement

Firstly I thank Allah for his bless of life and

Creation

To my family for their great support in my of

Life....

With my respect and love I dedicate this modest work

To my supervisor Dr. Hassan Elsiddig

and full thanks to Nada Salih Salih

&Dr. Moneera Abdallah

Radiation and isotope center-Khartoum (RICK)

ملخص الدراسة

اجريت هذه الدراسة الوصفية في ولاية الخرطوم في الفقر بين فبراير 2012 و حتى يوليو 2012 و تهدف للكشف عن العلاقة بين واسمات السرطان ، مستقبل الاستروجين، مستقبل البروجستيرون و هير 2 مع الكي اي 67 لدى السودانيين المصابين بسرطان الثدي . استخدمت في هذه الدراسة خمسين عينة عشوائية، 47 كانت من مرضى كانوا مصابين بالسرطان الغدي الغازي ،اثنان سرطان مخاطي و واحد سرطان حليمي، تراوحت اعمارهم بين 20 و 80 سنة .

لكل عينة طبقت اثنين من التقنيات النسيجية : الهيماتوكسلين والابوسين و كيمياء مناعه الانسجهن للكي اي 67.

كانت النتائج كالتالي : الاستروجين كان ايجابيا ل 27 عينة بنسبة (54%) والبروجستيرون كان ايجابيا ل 15 عينة بنسبة (30%) والهير 72 (14%) كان +1 و 10 (20%) ++ و 11 (22%) كانت +++, والكي اي 67 كان ايجابيا ل 29 عينة بنسبة (54%) بالاعتماد على هذه النتائج خلصت الدراسة الى انه لا توجد علاقة ذات دلالة احصائية بين الكي اي 67 مع مستقبل الاستروجين ، البروجستيرون والهير 2.

Abstract

This is a descriptive retrospective study carried out in Khartoum state_Sudan during the period from February 2012 to July 2012. The study aimed at detection the association of ki67 proliferative marker with ER, PR, and HER2 markers among Sudanese females with Breast Cancer random Samples from 50 patients were included (47 with invasive ductal carcinoma, 2 with Mucinous carcinoma, and one sample with papillary carcinoma). Their ages ranging from 20 to 80 years.

For each specimen 2 histopathological procedures were performed; H&E stain and ki67 immunohistochemistry.

ER was expressed among 27 (54%) of the samples, PR expressed among 15(30%) of the samples, while expression of HER2 seven samples (14%) were +, ten samples (20%) were ++, 11 samples (22%) were +++. The expression of Ki67 were on 29(54%) sample On the basis of these findings it is concluded that; there was no statistical association between ki67, and the demonstrated ER, PR and HER2.
