

الآية _____

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

(وَمَا أَرْسَلْنَاكَ إِلَّا رَحْمَةً لِّلْعَالَمِينَ)

صدق الله العظيم

سورة الأنبياء ﴿ 107 ﴾

Dedication

To that who taught me to write the first letter of the
alphabet, **My father.**

To the symbol of the absolute motherhood, the
unparalleled human being,
My mother.

To my brothers and sisters.

To all my colleagues who are too numerous to mention
by name, who advised, supported and encouraged me.

To my teachers

With respect and appreciation

Acknowledgements

Thanks are indeed to **ALMIGHTY ALLAH** worth all praise, for giving me health and power to complete this work.

I would like to express my sincere, heartfelt gratitude to my supervisor Dr. **Ali M. S. El-Eragi** for his guidance, valuable comments and critical advices throughout the course of this study.

I am very grateful to the staff of **Microbiological unit in Medical Army Hospital** for their help and kind assistance in analyzing the samples.

Abstract

This study was conducted in order to identify the bacterial pathogens associated with diabetic wounds and determining their antibiotic susceptibility patterns. A total of 50 diabetic patients were introduced in the present study that was conducted during June - August 2012. It has been found that wounds are highly infected by aerobic and anaerobic bacterial types; Different species were isolated from infected wound swab. 7 different species were isolated from the specimens they were *staphylococcus aureus* 9 (18%), *E. coli* 8 (16%). *Pseudomonas aeruginosa* 14 (28%). *Proteus vulgaris* 7 (14%). *Streptococcus pyogenes* 4 (8%). *Klebsiella pneumonia* 4 (8%) and *Clostridium spp* 2 (4%). *Pseudomonas aeruginosa* bacteria- was a predominant pathogen in diabetic wound infections. Most isolates were found to be sensitive to most antibiotics used and their susceptibility to amino glycoside was found to be more than 60% except *Pseudomonas aeruginosa* which is resistant. Gentamycin and streptomycin were found to be the most effective antibiotics against most Gram negative and Gram positive organisms.

ملخص البحث

اجريت هذه الدراسة من اجل تحديد مسببات الامراض البكتيرييه المرتبطه بجروح السكري واختبار الحساسيه للمضادات الحيويه .

50 مريضاً بالسكري الذين يعانون من التهابات في الجروح ادخلوا في هذه الدراسة التي اجريت في الفتره بين يونيو-أغسطس.2012 . تم عزل 7 أنواع مختلفة من العينات وهي المكورات العنقودية الذهبية 9 (18٪)، الاسكرشيا القولونية 8 (16٪) الزائفة الزنجارية 14 (28٪). المتقلبة الاعتيادية 7 (14٪). العقدية المقيحة 4 (8٪). الكلبسيلا التهاب الرئوي 4 (8٪) والمطثية 2 (4٪) وقد وجد ان نسبة الاصابه البكتيرييه كبيره وان الزائفه الزنجاريه البكتريا الممرضه هي السائده في التهابات جروح السكري. ووجد ان معظم العزلات حساسة لمعظم المضادات الحيوية المستخدمة وعثر قابليتها للغليكوزيدات الأمينية كانت أكثر من 60٪ باستثناء الزائفة الزنجارية التي هي مقاومة .وقد وجد ان الجنتاميسين والستربتوميسين الأكثر فعالية ضد البكتريا الإيجابية الغرام و السلبية الغرام.
