*To my parents*

*To my brothers and my sisters*

*To my friends*

## **Acknowledgments**

Firstly grateful thanks to ALMIGHTY ALLAH, for helping me in completing this research. I would like to acknowledge Dr. Abdelbagi Elnagi Mohamed, for his unfailing patience, expert advices, supervision, guidance and his valuable time. Extended thanks to the staff of the College of Medical Laboratory Science. My thanks and appreciations are extended to my colleges and friends who strongly supported me throughout this study.

A lot of thanks to the staff of Omdurman Maternity Hospital especially midwives for their kind help and co-operation during samples collection.

I thank all mothers contributed in this study for their cooperation and participation and to whom I am greatly indebted.

## Abstract

The main aim of this study was to serodetect of rubella IgM antibodies of newborn babies using Enzyme-Linked Immunosorbent Assay (ELISA). Umbilical cord blood samples were collected from a total of 92 normal vaginal deliveries inside the labor room by experienced midwives of Omdurman Maternity Hospital. Out of the 92 newborn babies 35 were males (38%) and 57 were females (62%) and their mother's age range from 17-37 years. However, 17 newborn babies (18.5%) had < 2.5 kg weight, 74 (80.4%) had 2.5 – 4 kg weight and 1(1.1%) had >4 kg weight. Out of 92 cord blood samples examined by the 4<sup>th</sup> generation ELISA 7(7.6%) were positive to anti-rubella IgM and 85(92.4%) were negative. It was found that 2 males (5.7%) and 5 females newborn babies (8.8%) were anti- rubella IgM positive and there was no significant association between gender and IgM result ( $p > 0.05$ ). Out of 7 IgM positive newborns, 2 babies had low birth weight (< 2.5 kg) (11.8%), 5 babies have normal birth weight (2.5–4 kg) (6.8%) and no significant association between them ( $p > 0.05$ ). The result also showed that out of 7 anti-rubella IgM positive babies, 6 mothers (7.1%) with less than 5 pregnancies and one mother (12.5%) with more than 5 pregnancies showing that no significant association of number of pregnancies and anti rubella IgM result ( $p > 0.05$ ). In addition, while 6 mothers (7.5 %) were found with no history of abortion, only one mother (8.3%) with history of abortion revealing no significant association of abortion and anti-rubella IgM ( $p > 0.05$ ). This study showed high frequency of CRI among newborns, although incidence of rubella infection was reduced worldwide. No evidence of rubella defects has been observed in newborn babies; therefore, birth weight of newborns was not affected. History of abortion and number of pregnancies of the mothers were not major risk factors of CRI.

## ملخص الدراسة

الهدف الرئيسى من هذه الدراسة هو الكشف المصلى الأجسام المضادة للحصبة الألمانية عند الأطفال حديثى الولادة باستخدام جهاز يعتمد على نظرية التقارب اللونى لتحديد الأجسام المضادة من النمط (IgM). تم أخذ 92 عينة من الحبل السرى لأطفال حديثى الولادة داخل غرف الولادة الطبيعية لمستشفى الولادة أمدرمان. من بين 92 أطفال حديثى الولادة, 35 منهم كانوا ذكورا (38%) و57 كانوا اناثا (62%) وتتراوح اعمار الأمهات ما بين 17 الى 37 سنة. من بين 92 حديثى الولادة, 17 كان وزنهم أقل من 2.5 كجم (18.5%), 74 كان وزنهم بين 2.5 الى 4 كجم (80.4%) وواحد وزنه أكثر من 4 كجم (1.1%). من بين 92 أطفال حديثى الولادة وجد ان 7 (7.6%) يعانون من الاصابة بفيروس الحصبة الألمانية الخلقية و85 (92.4%) لا يعانون من الاصابة. من بين 7 أطفال ايجابى الأجسام المضادة 2 منهم كانوا ذكورا (5.7%) و5 منهم كانوا اناثا (8.8%) كما انه لا توجد فروقات ذات دلالة احصائية بينهم (القيمة الاحتمالية أكبر من 0.05). وجد أن من بين ال7 ايجابى الأجسام المضادة 2 منهم (11.8%) كانوا وزنهم أقل من الوزن الطبيعى ( $2.5 >$  كجم) وحوالى 5 منهم كانت اوزانهم طبيعىة (4-2.5 كجم) (6.8%) كما أنه لا توجد فروقات ذات دلالة احصائية بين اوزانهم ووجود الأجسام المضادة من النمط (IgM) (القيمة الاحتمالية أكبر من 0.05). للمقارنة وجد أن من بين ال7 أطفال ايجابى الأجسام المضادة كان منهم 6 أمهات (7.1%) عدد مرات الحمل عندهم أقل من 5 مرات وواحدة (12.5%) كان لها أكثر من 5 مرات حمل كما أنه لا توجد فروقات ذات دلالة احصائية بين عدد مرات الحمل ووجود الأجسام المضادة لفيروس الحصبة الألمانية الخلقية لهؤلاء الاطفال (القيمة الاحتمالية أكبر من 0.05). وجد أيضا ان من بين ال7 ايجابى الاجسام المضادة 6 أمهات منهم لم يعانون من اجهاض سابق (7.5%) وواحد (8.3%) كان لها اجهاض سابق وكذلك وجد أنه لا توجد فروقات ذات دلالة احصائية بين تاريخ الاجهاض لهؤلاء الأمهات وانتقال الفيروس والاصابة بالحصبة الألمانية الخلقية (القيمة الاحتمالية أكبر من 0.05). من هذه الدراسة وجد أن هناك نسبة عالية للاصابة بفيروس الحصبة الألمانية فى الأطفال حديثى الولادة على الرغم من ان معدل الاصابة بهذا الفيروس فى تنازل فى مختلف انحاء العالم. لم يتم ملاحظة وجود عيب خلقى ظاهر لهؤلاء الأطفال لذا نجد ان اوزانهم عموما كانت طبيعىة. تاريخ الاجهاض وعدد مرات حمل الأمهات لا يؤثر على نسبة الاصابة.

## TABLES OF CONTENTS

Item.	Subjects	Page No.
