

الآية

بسم الله الرحمن الرحيم

قال تعالى :

(اَفَرَأَ يَاسْمِ رَبِّكَ الَّذِي خَلَقَ خَلْقَ الْإِنْسَانَ
مِنْ عَلَقٍ * اَفَرَأَ وَرَبِّكَ الْأَكْرَمُ * الَّذِي عَلِمَ
بِالْقَلْمَنِ * عَلِمَ الْإِنْسَانَ مَا لَمْ يَعْلَمْ)

صدق الله العظيم

سورة العلق الآيات 1-5

Dedication

To my parents

To my family; husband and lovely kids

To my sisters

To my teachers & friends

To Sudanese Health and care

I dedicate this work

Acknowledgement

In preparing this study I am grateful to Dr. Mohammed Siddig for his great effort, supervision, support, patience, guidance and valuable advice throughout the study period.

I am thankful to Dr. Yousif for his acceptance and great participation in this study. Deep thanks to Dr. Hatiam Algddal for continuous help during this study. Thanks also to my sister Hafsa Altoum for her encouragement and support. Thanks also extend to Dr. Hussam Eldin Algddal for his help, advice, and guidance.

Thanks also to Dr. Abualgasim Abbas for his advice and crucial contribution. Special thanks to Dr. Arwa ElBakheet for her great effort in this study. Special thanks to department of Virology in national health laboratory for help and support.

Deep thanks to my collage in department of histopathology in national Health laboratory.

Abstract

This is a descriptive prospective hospital base study, was conducted in Damazine Military hospital - Blue Nile state, during the period from March to July 2012. Aimed to detect CMV in product of conception (aborted tissue) using histochemical, serology and immunohistochemical methods.

Fifty samples were collected from females suffering of miscarriage for one time or recurrent attending Damazine military hospital, their ages were ranged between 16 to 41 year, with mean age 28.5 years. 50 sample (biopsy and serum), biopsies were fixed in formalin, processed in paraffin and cut using rotary microtom, two section were prepared from each block. One section was stained using Avidin-Biotin technique for immunohistochemical method to detect CMV antibodies, another section was stained using Hematoxylene and Eosin for histological method to detect CMV inclusion bodies, serum samples were used for CMV (IgG) using ELISA commercial diagnostic kits (DRG Instruments GmbH. Germany), data were analyzed using SPSS computer program.

Immunohistochemistry result revealed 10(20%) sections were positive, while 40(80%) were negative.

Histopathological results showed changes of CMV in 23(46%). While 27(54%) no changes.

CMV IgG antibodies were present in the serum samples of all women tested with ELISA.

This study showed insignificant relation between age, ethnic origin, economic status, education level, occupation, number of parity, blood transfusion, Intra Uterine Fetal Death (IUFD). Congenital malformation and Immunohistochemical result.

The study concluded that The CMV IgG results indicate high frequency of past HCMV infection in all tested groups; Histopathology still represents accurate results of CMV infection.

٢٠١٢-٢٠١٣

أجريت هذه الدراسة الوصفية المستشفوية الـ قدمية بمستشفى الدمازين العسكري -النيل الازرق في الفتره من مارس حتى يوليو 2012 . هدفت الدراسة لاكتشاف الفيروس المضخم للخلايا في بقايا الحمل (النسيج المجهض) باستخدام صبغة كيميا الانسجه الكشف المصلي وصبغة كيميا الانسجه المناعية.

تم جمع 50 عينة من النساء اللاتي يعانيين من الإجهاض تراوحت أعمارهن بين 16-41- ومتوسط اعماره 28.5 تم اخذ الخزع النسيجية و عينات المصل، تم تثبيت الخزع النسيجية ب الفورملين و معالجتها باش مع البرافين ثم قطعها بالميكروتوم الدوار. تم تحضير مقطعين من كل قالب، احدى المقطعين تم صبغه بصبغة الهيماتوكسيلين والابوسين لمعرفة التغييرات الشكلية والآخر تم صبغه بصبغة الانسجة المناعية باستخدام تقنية الافدين والباليوتين للكشف عن الاجسام المضاده للفيروس المضخم للخلايا وعينة من الدم للكشف المصل لي للكشف عن الاجسام المضاده باستخدام مقياسة الامتصاص المناعي المرتبط بالانزيم (ELIZA). تم تحليل البيانات باستخدام البرنامج الاحصائي المحوسب SPSS.

نتائج كيميا الانسجة المناعية اظهرت ان 10 (20%) مقطع اعطت نتيجة مناعية ايجابية

للفيروس بينما 04 (80%) اعطت نتيجة سالبة للفيروس.

وكانت نتيجة تشخيص الانسجة المريضة 46% اظهرت تغيرات الفيروس في النسيج بينما 54% لم تظهر هذه التغيرات.

اعطت الاجسام المضادة من النوع IgG نتيجة ايجابية للفيروس المضخم
للخلايا في جميع عينات المصل .

اظهرت الدراسة عدم وجود علاقة ذات دلالة احصائية بين العمر ، القبيلة ،
الحالة الاقتصادية ، مستوى التعليم ، العمل ، نقل الدم ، موت الجنين داخل
الرحم ، التشوهات الخلقية ، عدد الولادات ونتيجة التشخيص بكميات الانسجة
المناعية

خلصت الدراسة الى ان هناك معدلات عالية للاصابة السابقة بالفيروس .
الكشف عن الفيروس المضخم للخلايا باستخدام تكنique المريضة ما زال
يعطي نتائج دقيقة لوجود الفيروس .
