List of tables

- 1.1 causes of acute tubular necrosis
- 1.2 comparative between US and NM
- 1.3 A lower dose of activity
- 4-1 The percentage of male to female
- 4-2 A summary of the results of NM and US compared with clinical follow up and laboratory.
- 4-3 The patients diagnosed by NM and US.
- 4-4 The sensitivity & specificity & accuracy of US and NM

Abstract

In this study the researcher assessed the effectiveness of ultrasound and nuclear medicine images in diagnosis of renal failure and compared between two images modalities (nuclear medicine and ultrasound), when they are applied for the same cases.

This study is conducted in INMO nuclear medicine department and renal hospital.

Random sample of thirty patients, 16 males and 14 females with different ages were chosen, ultra sound and nuclear medicine images done to demonstrate renal failure.

Most of these cases, were diagnosed correctly by the two imaging modalities, while 6 patients were diagnosed only by nuclear medicine. The sensitivity of nuclear medicine is 96% and ultrasound 80% .On the other hand we found that the ultrasound and nuclear medicine have the same specificity and accuracy (100%). From these results we concluded that ultra sound has a role in the diagnosis of renal failure but nuclear medicine scanning is more sensitive.

However, because ultrasound is good in assessing morphological changes (e.g renal failure due to bilateral renal stones) and nuclear medicine is good in assessing function, both imaging modalities when performed together help to obtain accurate morphological and functional changes (i.e. they are complimentary rather than competitive).

الخلاصة

فى هذه الدراسة تم قياس فعالية الموجات فوق الصوتية و الطب النووى فى تشخيص الفشل الكلوى والمقارنة بين التقنيتين عند اجرائهما معا(الموجات الصوتية والطب النووى)

اجريت هذه الدراسة فى قسم الطب النووى بمعهد الطب النووى والاحياء الجزيئية وعلاج الاورام , وعيادات الموجات فوق الصوتية , ومستشفى الكلى بمدنى.

اخذت عينة عشوائية من المرضى (نساء ورجال) تتكون من ثلاثين مريض من مختلف الاعمار والاعراض , خضع كل المرضى لاجراء الفحصين (الموجات الصوتية والطب النووى) لتوضيح التشخيص للفشل الكلوى.

كان هنالك توافق بين الموجات الصوتية والطب النووى فى التشخيص ما عدا ستة حالات تم تشخيصها بفحص الطب النووى دون الموجات فوق الصوتية.الا اننا وجدنا حساسية الطب النووى 96% والموجات الصوتيه 80%- اى ان الطب النووى اكثر حساسيه .

لذا يمكن القول انه يمكن تشخيص الفشل الكلوى باجراء الفحصين معا للحصول على التشخيص الدقيق لاطهار التغيرات التشريحية والوظيفيه-اى ان الفحصين يكملان بعضهما البعض.
