

256K (32K x 8) CMOS UV Erasable PROM

FEATURES

- High Speed Performance — 150ns Maximum Access Time
- CMOS Design — Ultra Low Power Dissipation
 - 20mA Active Current
 - 100 μ A Standby Current
- OTP (One Time Programming) Available
- Auto-Insertion-Compatible Plastic Packages
- Auto ID™ Identification; Aids Automated Programming
- Separate Chip Enable and Output Enable Control Inputs
- Two Programming Algorithms Allow Improved Programming Times
 - Fast Programming
 - Rapid-Pulse Programming
- Organized 32K x 8 — JEDEC Standard Pinouts
 - 28 Pin Dual In Line Package
 - 32 Pin Chip Carrier (Leadless or Plastic)
- Available for Extended Temperature Ranges:
 - Commercial (C) = 0° to 70°C
 - Industrial (I) = -40° to 85°C
 - Military** (M) = -55° to +125°C

DESCRIPTION

The General Instrument Microelectronics 27C256 is a CMOS 256K bit ultraviolet light Erasable (electrically) Programmable Read Only Memory. The device is organized as 32K words by 8 bits (32K bytes). Accessing individual bytes from an address transition or from power-up (chip enable pin going low) is accomplished in less than 150ns. This very high speed device allows the most sophisticated microprocessors to run at full speed without the need for WAIT states. CMOS design and processing enables this part to be used in systems where reduced power consumption and enhanced reliability are requirements.

The 27C256 is available in an extensive selection of package options, windowed CERDIP packages and leadless chip carriers provide reprogrammability needed during prototyping or preproduction. Plastic DIP packages and plastic leaded chip carriers are also available to provide the cost effectiveness needed in a production environment. These plastic devices are auto-insertion compatible and are one-time programmable (OTP) parts.

PIN CONFIGURATIONS

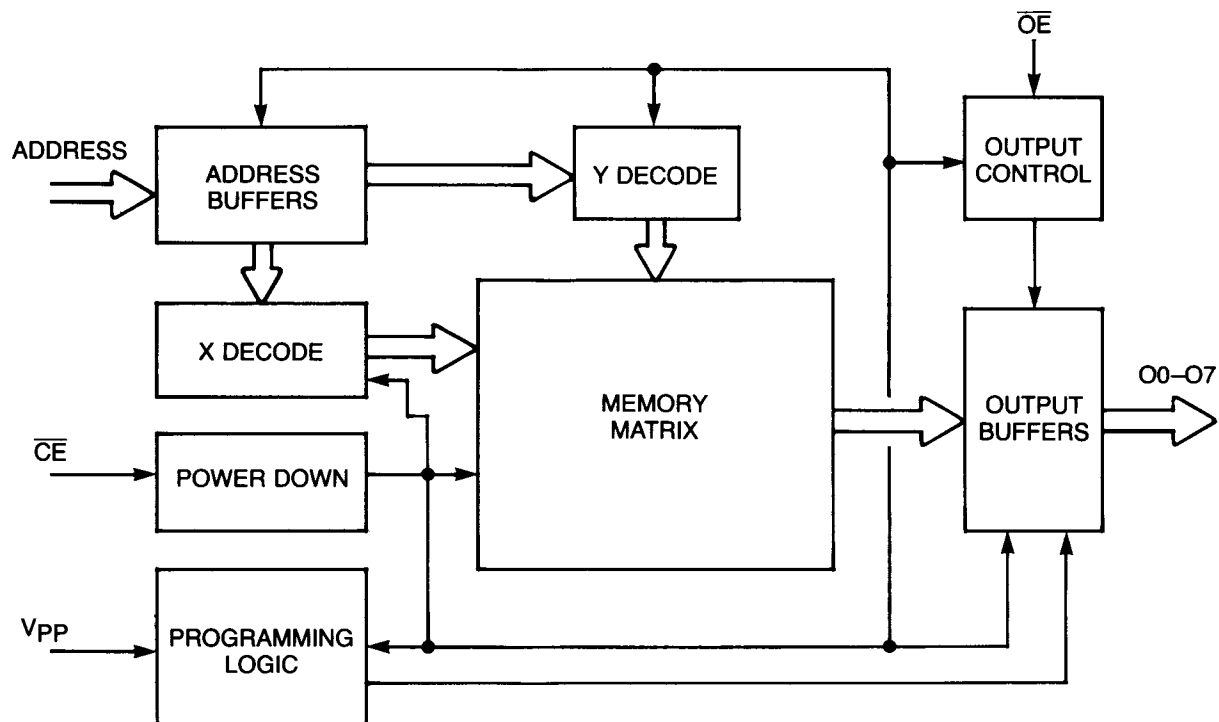

● Pin 1 indicator on PLCC on top of package

*DC (don't connect on PLCC package)

34 *Res* *Only*
005966
5966 *GI*

**Military Version (MR) screened to MIL STD 883
Rev. C, Method 5004 Test Specification.

BLOCK DIAGRAM

MODES

MODES	$\overline{\text{CE}}$	$\overline{\text{OE}}$	V _{PP}	A ₉	O0-O7
Read	V _{IL}	V _{IL}	V _{DD}	X	D _{out}
Program	V _{IL}	V _{IH}	+ 12V	X	D _{in}
Program Verify	V _{IH}	V _{IL}	+ 12V	X	D _{out}
Program Inhibit	V _{IH}	V _{IH}	+ 12V	X	High Z
Standby	V _{IH}	X	V _{DD}	X	High Z
Output Disable	V _{IL}	V _{IH}	V _{DD}	X	High Z
Identity	V _{IL}	V _{IL}	V _{DD}	+ 12V	Identity Code

READ MODE (See Timing Diagrams and AC Characteristics)

Read mode is accessed when

- the \overline{CE} pin is low to power up (enable) the chip.
- the \overline{OE} pin is low to gate the data to the output pins.

For Read operations, if the addresses are stable, the address access time (t_{ACC}) is equal to the delay from \overline{CE} to output (t_{CE}). Data is transferred to the output after a delay (t_{OE}) from the falling edge of \overline{OE} .

STANDBY MODE

The standby mode is defined when the \overline{CE} pin is high and a program mode is not defined.

When these conditions are met, the supply current will drop from 20mA to 100 μ A.

OUTPUT ENABLE

This feature eliminates bus contention in multiple bus microprocessor systems and the outputs go to a high impedance when

- The \overline{OE} pin is high and a program mode is not defined.

ERASE MODE

Windowed products offer the ability to erase the memory array. The memory matrix is erased to the all "1" 's state as a result of being exposed to ultraviolet light. To ensure complete erasure, a dose of 15 watt-second / cm² is required. This means that the device window must be placed within one inch and directly underneath an ultraviolet lamp with a wavelength of 2537 Angstroms and intensity of 12,000 μ watt / cm² for 20 minutes.

PROGRAMMING MODE

Two programming algorithms are available. The fast programming algorithm is the industry-standard programming mode that requires both initial programming pulses and overprogramming pulses. A flow-chart of the fast programming algorithm is shown in Figure 1.

The rapid-pulse programming algorithm has been developed to improve on the programming throughput times in a production environment. Up to 25 100-microsecond pulses are applied until the byte is verified. No overprogramming is required. A flowchart of the rapid-pulse programming algorithm is shown in Figure 2.

Programming takes place when

- V_{PP} is brought to the proper V_H level,
- V_{DD} is brought to the proper V_H level, and
- the \overline{OE} pin is high.
- the \overline{CE} pin is low,

Since the erased state is "1" in the array, programming of "0" is required. The address to be programmed is set via pins A0–A14 and the data to be programmed is presented to pins O0–O7. When data and address are stable, a low-going pulse on the \overline{CE} line programs that location.

VERIFY

After the array has been programmed it must be verified to ensure all the bits have been correctly programmed. This mode is entered when all the following conditions are met:

- V_{PP} is at the proper V_H level,
- V_{DD} is at the proper V_H level, and
- the \overline{CE} pin is high.
- the \overline{OE} line is low,

INHIBIT

When programming multiple devices in parallel with different data, only \overline{CE} need be under separate control to each device. By pulsing the \overline{CE} line low on a particular device, that device will be programmed and all other devices with \overline{CE} held high will not be programmed with the data (although address and data will be available on their input pins).

MANUFACTURERS IDENTITY

In this mode specific data is outputted that identifies the manufacturer as General Instrument Microelectronics, the device type, where the device is manufactured, etc. This mode is entered when pin (A9) is taken up to between 11.5–12.5V. The \overline{CE} and \overline{OE} lines must be at V_{IL} . A0 is used to access any of the two non-erasable bytes whose data appears on O0 through O7.

The General Instrument Microelectronics identity code is as follows:

Pin	A0	O7	O6	O5	O4	O3	O2	O1	O0	Hex Code
Identity										
Manufacturer	V_{IL}	0	0	1	0	1	0	0	1	29
Device Type*	V_{IH}	1	0	0	0	1	1	0	0	8C

*Code subject to change.

ELECTRICAL CHARACTERISTICS

Maximum Ratings*

V_{DD} and input voltages w.r.t. V_{SS}	-0.6 to +6.25V
V_{pp} voltage w.r.t. V_{SS} during programming	-0.6 to +14V
Voltage on A9 w.r.t. V_{SS}	-0.6 to +13.5V
Storage temperature	-65°C to +150°C
Ambient temperature with power applied.	-65°C to +125°C

Set Up Conditions for DC Characteristics (Read Operation)

$V_{DD} = +5V \pm 10\%$	
T_{AMB} : Commercial (C) =	0°C to 70°C
Industrial (I) =	-40°C to +85°C
Military (M) =	-55°C to +125°C

***Notice:** Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

DC CHARACTERISTICS (Read Operation)

PARAMETER	SYM	MIN	MAX	UNITS	CONDITIONS
Inputs Address lines A0–A14 Data lines (program mode) O0–O7 \overline{CE} & \overline{OE} Logic "1" Logic "0" Leakage	V_{IH} V_{IL} I_{IL}	2.0 -0.1 -10	$V_{DD} + 1$ 0.8 10	V V μA	$V_{IN} = 0$ to V_{DD}
Input Capacitance	C_{IN}		6	pF	$V_{IN} = 0V$, $T_{AMB} = 25^\circ C$, $f = 1MHz$
Outputs In read/verify mode O0–O7 Logic "1" Logic "0" Leakage	V_{OH} V_{OL} I_{OL}	2.4 -10	0.45 10	V V μA	$I_{OH} = -400\mu A$ $I_{OL} = 2.1mA$ $V_{OUT} = 0$ to V_{DD}
Output Capacitance	C_{OUT}		12	pF	$V_{OUT} = 0V$, $T_{AMB} = 25^\circ C$, $f = 1MHz$
Power Supply Current I_{DD} Active (TTL Inputs)	I_{DD}		20	mA	$V_{DD} = 5.5V$, $V_{pp} = V_{DD}$, $\overline{OE} = \overline{CE} = V_{IL}$, $I_{OUT} = 0mA$ $T_{AMB} = 0^\circ C$ to $70^\circ C$, $V_{IL} = -0.1V$ to $0.8V$, $V_{IH} = 2.0V$ to V_{DD}
I_{DD} Active (TTL Inputs) (Extended Temp. Range)	I_{DD}		25	mA	$V_{DD} = 5.5V$, $V_{pp} = V_{DD}$, $\overline{OE} = \overline{CE} = V_{IL}$, $I_{OUT} = 0mA$ $T_{AMB} = -55^\circ C$ to $125^\circ C$, $V_{IL} = -0.1V$ to $0.8V$, $V_{IH} = 2.0V$ to V_{DD}
I_{DD} Standby (TTL Inputs)	$I_{DD(S)TTL}$		2	mA	$\overline{CE} = V_{IH}$, $T_{AMB} = 0^\circ C$ to $70^\circ C$
I_{DD} Standby (TTL Inputs) (Extended Temp. Range)	$I_{DD(S)TTL}$		3	mA	$\overline{CE} = V_{IH}$ $T_{AMB} = -55^\circ C$ to $125^\circ C$
I_{DD} Standby (CMOS Inputs)	$I_{DD(S)CMOS}$		100	μA	$\overline{CE} = V_{DD} \pm 0.2V$
I_{pp} (Read Mode) V_{pp} READ VOLTAGE	V_{pp}	$V_{DD} - 0.7$	100 V_{DD}	μA V	$V_{pp} = 5.5V$ (NOTE 1)

Note: (1) V_{DD} must be applied simultaneously or before V_{pp} and removed simultaneously or after V_{pp} .

AC CHARACTERISTICS (Read Operation)

T_A: Commercial (C) = 0°C to 70°C
 Industrial (I) = -40°C to +85°C
 Military (M) = -55°C to +125°C

AC TESTING WAVEFORM
 $V_{IH} = 2.4V$ AND $V_{IL} = 0.45V$
 $V_{OH} = 2.0V$ AND $V_{OL} = 0.8V$
 Output Load = 1 TTL Load + 100pF

Note: 27C256-15 is only available in commercial temperature range.

SYM	PARAMETER	27C256-15		27C256-17		27C256-20		27C256-25		UNITS	TEST CONDITIONS
		MIN	MAX	MIN	MAX	MIN	MAX	MIN	MAX		
t _{ACC}	Address to Output Delay		150		170		200		250	ns	$\overline{CE} = \overline{OE} = V_{IL}$
t _{CE}	\overline{CE} to Output Delay		150		170		200		250	ns	$\overline{OE} = V_{IL}$
t _{OE}	\overline{OE} to Output Delay		70		70		75		100	ns	$\overline{CE} = V_{IL}$
t _{OFF}	\overline{OE} to O/P High Impedance	0	50		50	0	55	0	60	ns	$\overline{CE} = V_{IL}$
t _{OH}	Output Hold From Address \overline{CE} or \overline{OE} , whichever goes first	0		0		0		0		ns	$\overline{CE} = \overline{OE} = V_{IL}$

READ WAVEFORMS

Notes:

- (1) T_{OFF} is specified for \overline{OE} or \overline{CE} , whichever occurs first.
- (2) \overline{OE} may be delayed to t_{CE}-t_{OE}, after the falling edge of \overline{CE} without impact on t_{CE}.
- (3) This parameter is only samples and is not 100% tested.

DC PROGRAMMING CHARACTERISTICS

$T_A = 25 \pm 5^\circ\text{C}$ (see programming algorithm for V_{DD} and V_{PP} voltages).

SYMBOL	PARAMETER	MIN	MAX	UNITS	CONDITIONS (SEE NOTE 1)
I_{LI}	Input Current (All Inputs)	-10	10	μA	$V_{IN} = V_{IL} \text{ or } V_{IH}$
V_{IL}	Input Low Level (All Inputs)	-0.1	0.8	V	
V_{IH}	Input High Level	2.0	$V_{DD} + 1$	V	
V_{OL}	Output Low Voltage During Verify		0.45	V	$I_{OL} = 2.1\text{mA}$
V_{OH}	Output High Voltage During Verify	2.4		V	$I_{OH} = -400\mu\text{A}$
I_{DD2}	V_{DD} Supply Current (Program & Verify)		20	mA	
I_{PP2}	V_{PP} Supply Current (Program)		25	mA	$\overline{CE} = V_{IL}$
V_{ID}	A9 Product Identification Voltage	11.5	12.5	V	

Note: (1) V_{DD} must be applied simultaneously or before V_{PP} and removed simultaneously or after V_{PP} .

AC PROGRAMMING CHARACTERISTICS

Conditions: 25°C \pm 5°C (see programming algorithm for V_{DD} and V_{pp} voltages).

Program, Program Verify, and Program Inhibit Modes

AC TESTING WAVEFORM

$V_{IH} = 2.4V$ and $V_{IL} = 0.45V$

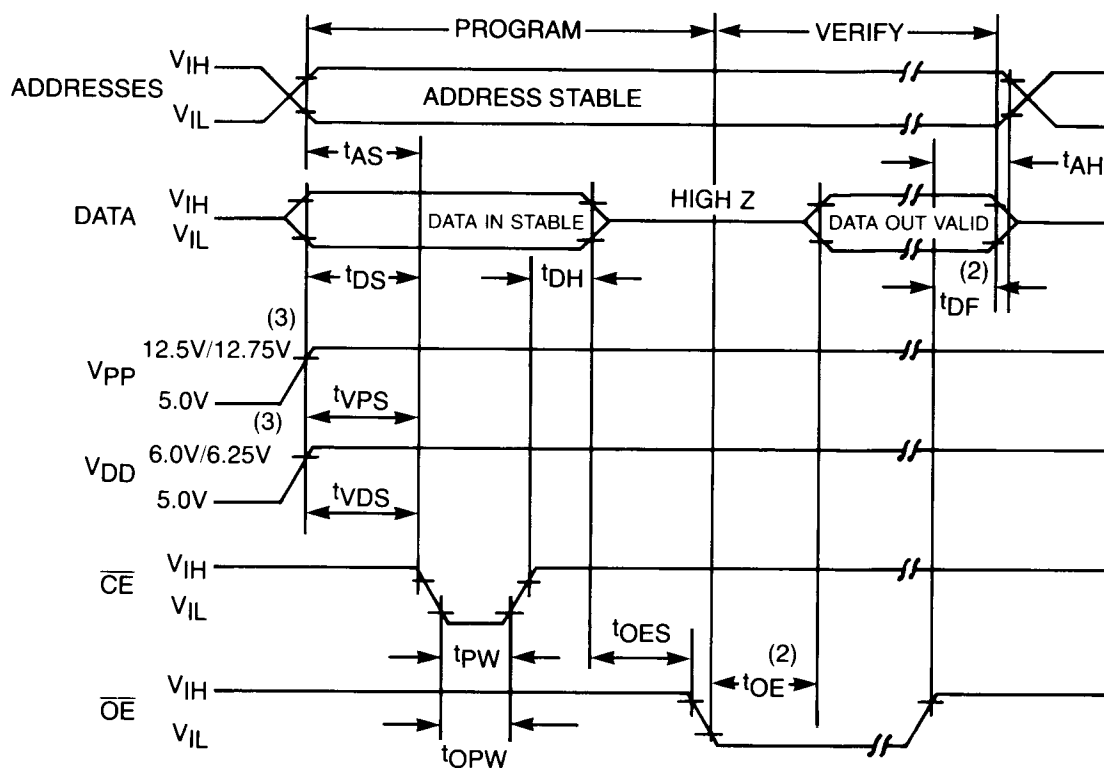

$V_{OH} = 2.0V$ and $V_{OL} = 0.8V$

Output Load = 1 TTL Load + 100pF

PARAMETER	SYM	MIN	TYP	MAX	UNITS
Address Set-Up Time	t_{AS}	2			μs
Data Set-Up Time	t_{DS}	2			μs
Data Hold Time	t_{DH}	2			μs
Address Hold Time	t_{AH}	0			μs
Float Delay ³	t_{DF}	0		130	ns
V_{DD} Set-Up Time	t_{VDS}	2			μs
Program Pulse Width ¹	t_{PW}	0.95	1	1.05	ms
Program Pulse Width ¹	t_{PW}	95	100	105	μs
\overline{CE} Set-Up Time	t_{CES}	2			μs
\overline{OE} Set-Up Time	t_{OES}	2			μs
V_{pp} Set-Up Time	t_{VPS}	2			μs
Overprogram Pulse Width ²	t_{OPW}	2.85		78.75	ms
Data valid from \overline{OE}	t_{OE}			70	ns

- Notes: (1) For fast programming algorithm, initial program pulse width tolerance is 1 msec \pm 5%, for rapid-pulse programming algorithm; initial programming pulse width tolerance is 100 μ sec \pm 5%.
- (2) For fast programming algorithm, the length of the overprogram pulse may vary from 2.85 to 78.75 msec as a function of the iteration counter value.
- (3) This parameter is only sampled and is not 100% tested. Output float is defined as the point where data is no longer driven — see Timing Diagram.

PROGRAMMING WAVEFORMS(1)

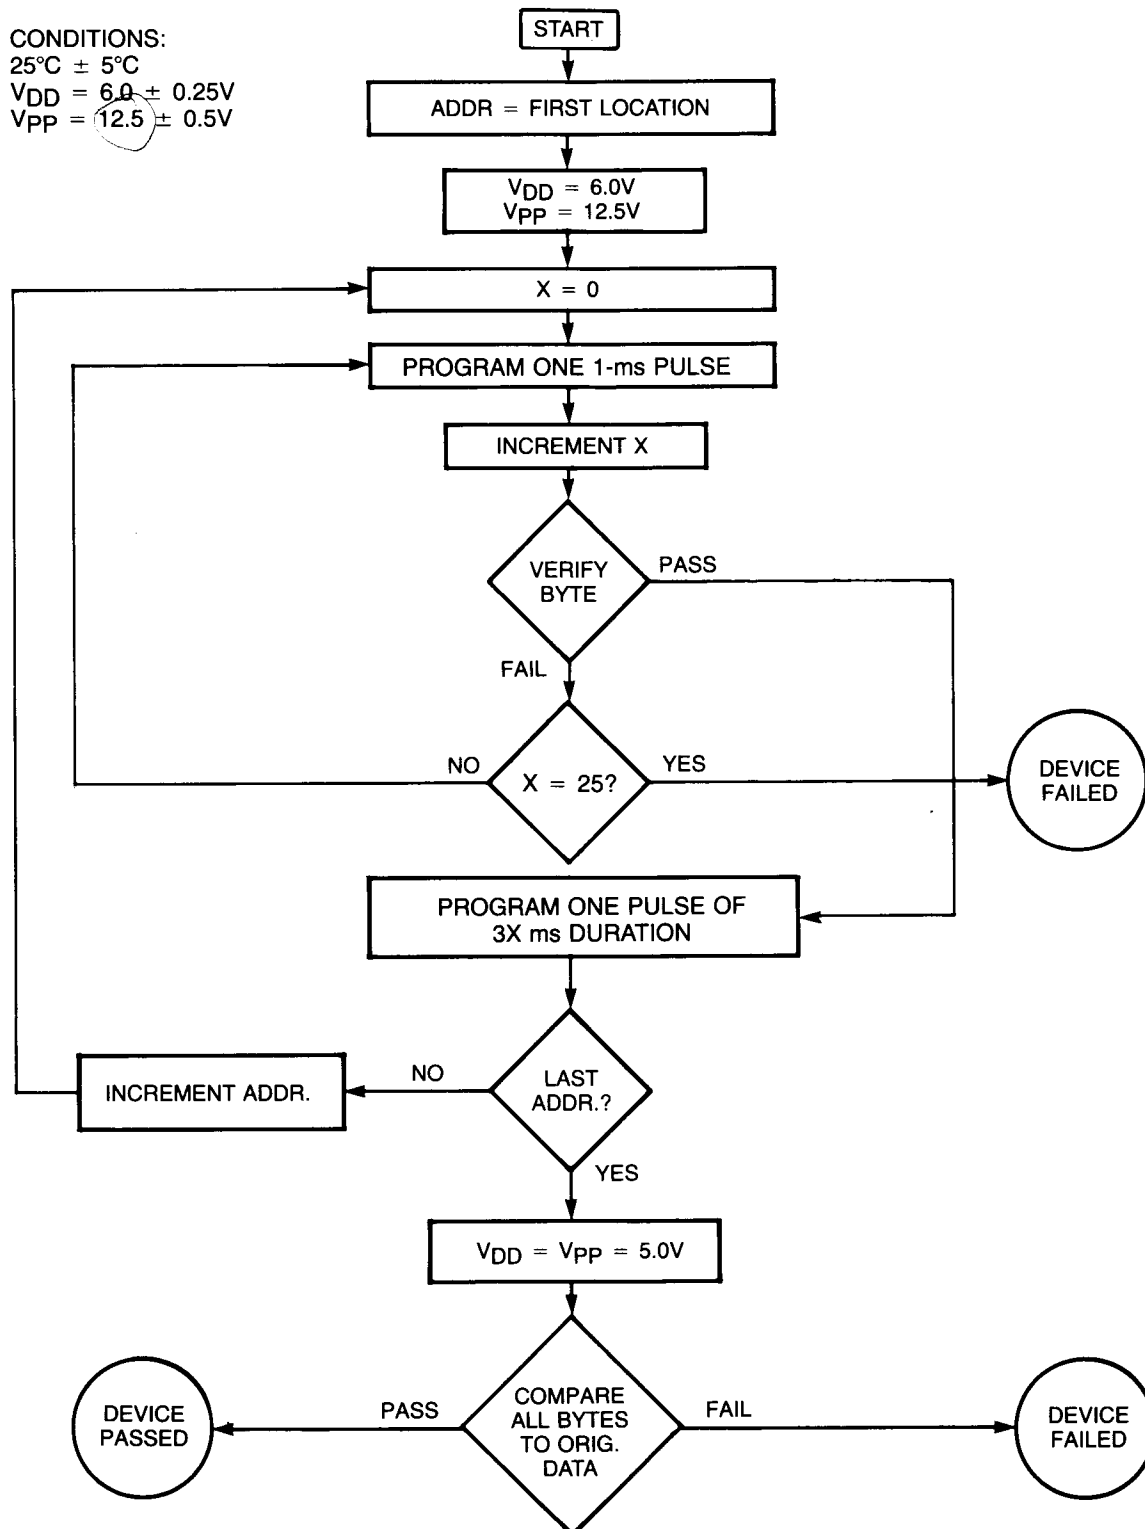

Notes:

- (1) The input timing reference level is 0.8V for V_{IL} and 2.0V for V_{IH} .
- (2) t_{DF} and t_{OE} are characteristics of the device but must be accommodated by the programmer.
- (3) $V_{DD} = 6.0 \pm 0.25V$, $V_{PP} = 12.5 \pm 0.5V$ for fast programming algorithm.
 $V_{DD} = 6.25 \pm 0.25V$, $V_{PP} = 12.75 \pm 0.25V$ for rapid-pulse programming algorithm.

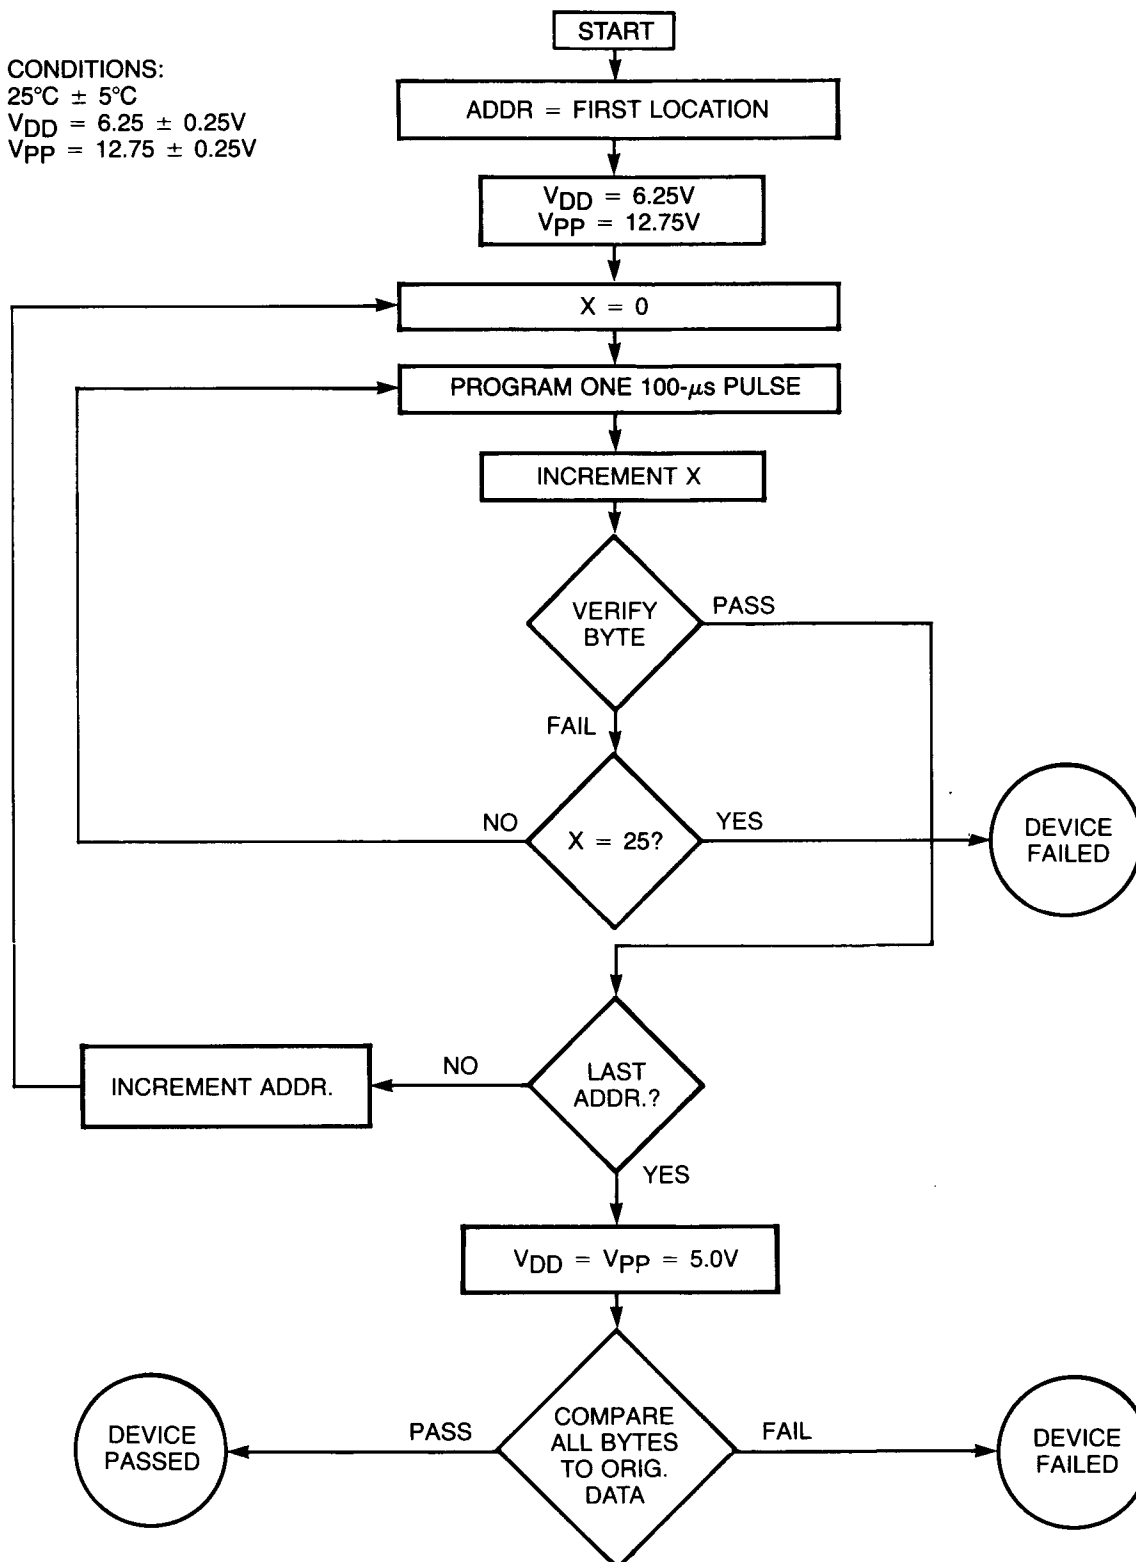

FAST PROGRAMMING ALGORITHM (Figure 1)

CONDITIONS:

 $25^{\circ}\text{C} \pm 5^{\circ}\text{C}$ $V_{\text{DD}} = 6.0 \pm 0.25\text{V}$ $V_{\text{PP}} = 12.5 \pm 0.5\text{V}$ 

RAPID-PULSE PROGRAMMING ALGORITHM (Figure 2)

CONDITIONS:

 $25^{\circ}\text{C} \pm 5^{\circ}\text{C}$ $V_{\text{DD}} = 6.25 \pm 0.25\text{V}$ $V_{\text{PP}} = 12.75 \pm 0.25\text{V}$
